Low Voltage Motors

Whilst every care has been taken to ensure the accuracy of the information contained in this publication, due to a policy of continuous product development and improvement we reserve the right to supply products which may differ slightly from those drawn or described in this publication.

For critical applications please refer to your local Teco Office.

Table of Contents

TECO History

1956 Company foundation and start of production in the first **TECO** factory in San-Chung, TAIWAN
1965 Production capacity increased by opening new factory in Shin-Chuan, TAIWAN
1966 Start of close technical co-operation with Hitachi, Yaskawa and Taiyo
1979 Further production capacity increase by opening a factory in Chung Li, TAIWAN Plant I (Heavy Motor Plant)
1987 Opened Chung Li Plant II for serial motor production (Small Motor Plant)
1987 Started Joint Venture with Westinghouse Motor Company, USA, one of the leading motor manufacturers in North America
1991 Foundation of **TECO** Perai, Penang Provence, MALAYSIA, to serve the local market with low voltage motors
1995 100% take over of Westinghouse motor business by **TECO.**
Foundation of **TECO** Westinghouse Motor Company
2000 Opened **TECO** factory for low voltage motors in Suzhou, Jiangsu Provence, CHINA
2003 Opened **TECO** factory for low and medium voltage motors in Wuxi, CHINA
2005 Opened third **TECO** factory in Nanchang, Jiangxi Provence, CHINA
2006 Opened factory in Huyen Long Thanh, Tinh Dong Nai Provence, VIETNAM to increase local business
2008 Opened **TECO** repair and assembling plant in Dammam, KINGDOM OF SAUDI ARABIA, on joint venture basis
2008 Established **TECO** Fuan in Fujian Provence, CHINA, with a decision for construction of a new plant
2010 Starting the production of aluminium motors and semi finished aluminium parts at **TECO** Fuan factory In Fujian Provence, CHINA

TECO Actual

In 2010 TECO with 30 subsidiaries worldwide and affiliates gained a turnover of 1 Billion EURO achieved with approximately 10.000 employees worldwide. More than 50% of the turnover was generated by the Electric Motor business. TECO is listed as reference value on the stock exchange in Taipei, TAIWAN.

The detailed financial data can be downloaded from the TECO website http://www.teco.com.tw/en_version under "investor relations".

TECO is mainly focused on
- Sustainable development with new competitive advantages
- Enhancing service quality
- Development and education of experienced employees
- Creating outstanding products

TECO has
- Significant Experience in the Motor Industry
- Experienced Engineering and Manufacturing Staff
- State of the art factories in the most important manufacturing markets
- State of the Art Testing Facilities for the full power and voltage range of its motors

TECO Europe

TECO EUROPE have been established since 1993 and have offices in the UK, Netherlands, Germany, France, Italy, Spain and Switzerland.
As a wholly owned subsidiary of the multinational TECO Electric and Machinery Co. Ltd. of Taiwan and having acquired Westinghouse Motors in 1993 we are part of the 3rd largest global electric motor manufacturer. TECO is currently a $12.6B turnover organisation in diverse business sectors such as Factory Automation, Telecoms, Consumer Electronics and Restaurants.

Within the European Operation we have stocks of motors and drives in Germany, the UK and the Netherlands and a comprehensive network of specialist distributors, so whatever your motor and drive requirement our experienced engineering team can help and advise on the correct products to suit your applications.

1 General

1.1 Standards and regulations

There are different international standards for electrical machines, e.g.

- the international “IEC” standard or
- the North American “NEMA”- standard and others.
  The motors covered by this catalogue are designed and manufactured according to the latest IEC standards. Furthermore they fulfil the relevant regulations of the European Community (“EC Regulations”).

List of national and international standards and regulations applied:

Title	International IEC	Europe EN/Directive	Germany DIN/VDE
Rotating electrical machines - Part 1: Rating and performance	60 034-1	60 034-1	DIN EN 60 034-1 VDE 0530 Part 1
Rotating electrical machines - Part 2-1:Standard methods for determining losses and efficiency from tests	**60 034-2-1:2007**	**60 034-2-1:2007**	**DIN EN 60 034-2 VDE 0530 Part 2**
Rotating electrical machines - Part 5: Degrees of protection provided by the integral design of rotating electrical machines (IP code) - Classification	60 034-5	60 034-5	DIN EN 60 034-5 VDE 0530 Part 5
Rotating electrical machines - Part 6: Methods of cooling (IC Code)	60 034-6	60 034-6	DIN EN 60 034-6 VDE 0530 Part 6
Rotating electrical machines - Part 7: Classification of types of construction, mounting arrangements and terminal box position (IM Code)	60 034-7	60 034-7	DIN EN 60 034-7 VDE 0530 Part 7
Rotating electrical machines - Part 8: Terminal markings and direction of rotation	60 034-8	60 034-8	DIN EN 60 034-8 VDE 0530 Part 8
Rotating electrical machines - Part 9: Noise limits	60 034-9	60 034-9	DIN EN 60 034-9 VDE 0530 Part 9
Rotating electrical machines - Part 11: Thermal protection	60 034-11	60 034-11	
Thermistors, PTC			DIN 44081:1980-6
Rotating electrical machines - Part 12: Starting performance of single-speed three-phase cage induction motors	60 034-12	60 034-12	DIN EN 60 034-12 VDE 0530 Part 12
Rotating electrical machines - Part 14: Mechanical vibration of certain machines with shaft heights 56 mm and higher - Measurement, evaluation and limits of vibration severity	60 034-14	60 034-14	DIN EN 60 034-14 VDE 0530 Part 14
Rotating electrical machines - Part 17: [3)]			
Cage induction motors when fed from converters- Application guide	TS 60034-17		
Mechanical vibration; balancing shaft and fitment key convention			DIN ISO 8821
Mechanical vibration - Balance quality requirements for rotors in a constant (rigid) state - Part 1: Specification and verification of balance tolerances			DIN ISO 1940-1:2004-04

Title	International IEC	Europe EN/Directive	Germany DIN/VDE
Rotating electrical machines - Part 30: Efficiency classes of single-speed, three-phase, cage-induction motors (IE-code)	**60 034-30**		
IEC standard voltages	60 038	-	DIN IEC 60 038
Dimensions and output series for rotating electrical machines - Part 1: Frame numbers 56 to 400 and flange numbers 55 to 1080	60 072-1 [1)]	50 347	DIN EN 50 347 [2)]

Protection of steel structures from corrosion by organic and metallic coatings			DIN 55 928
Low Voltage Directive 2006/95/EC		2006/95/EC	
EMC Directive 2004/108/EC		2004/108/EC	
Machinery Directive 2006/42/EC [4)]		2006/42/EC	

[1)] Applicable for dimensions and frame sizes only
[2)] Applicable for single speed motors up to frame size 315M only
[3)] As far as applicable
[4)] not directly applicable for low voltage motors

Table 1-1: Standards and regulations applied

Remarkable latest innovations in above mentioned standards are

- **IEC 60034-2-1** (...standard methods for determining losses and efficiency from tests) and
- **IEC 60034-30** (...efficiency classes of single-speed, three-phase cage-induction motors; IE-code).

By IEC 60034-2-1 an improved procedure for testing of the efficiency is described. In general the nominal efficiency evaluated by this method is slightly lower than the value based on the formerly used procedure.
IEC 60034-30 defines classes of efficiency for standard motors ("International Efficiency"):

"IE1" (Standard Efficiency),
"IE2" (High Efficiency),
"IE3" (Premium Efficiency) and
"IE4" (Super Premium efficiency).

These efficiency class definitions demand a minimum efficiency value depending on power rating and pole number of the motor.
(This classification replaces the formerly used efficiency class definitions like e.g. "eff1".)
The motors in this catalogue (category IE2 and IE3) fulfil ore override these minimum levels.

Depending on local regulations the current and future use of these advanced motors is mandatory.

The current regulation within the European Community is EG 640/2009, as a part of the EU's eco-design project.

It covers 2-, 4-, 6- and 8-pole three phase low voltage induction motors with power rating from 0,75 kW up to 375 kW (excepted of special motors like explosion proof motors and others).
Schedule for mandatory use of these motors:

- June 2011: efficiency **class** IE2 for all motors covered by this regulation
- January 2015: efficiency class IE3 for motors from 7,5 kW up to 375 kW (or IE2 if inverter operated)
- January 2017: efficiency class IE3 for all motors from 0,75 kW up to 375 kW (or IE2 if inverter operated).

A sample for efficiency requirements is given in the figure below
(4-pole motors, classification "IE2" and "IE3"):

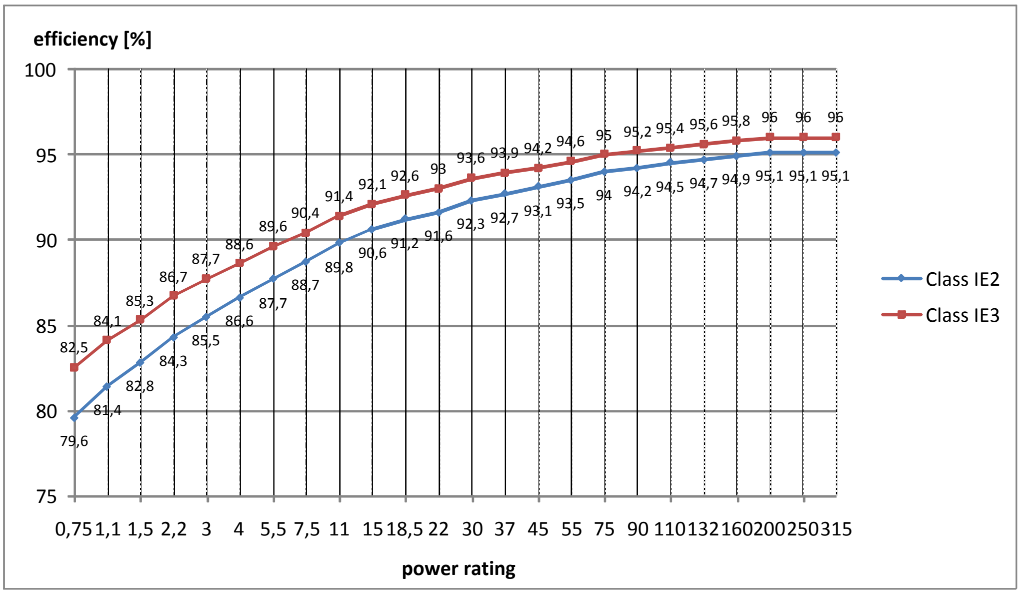

Figure 1-1: Minimum nominal efficiency for 4-pole motors acc. class IE2 and IE3 (IEC 60034-30)

1.2 Basics, terms and definitions

Induction machines are the commonly most used motor type for general drive applications. They are extremely durable and robust and provide an economic drive solution, even under severe environmental conditions.
They can be used for direct line operation (fixed speed) or in combination with a frequency inverter (variable speed drive system).
They are available in a lot of varieties.
Some typical characteristics are listed below:

1.2.1 Power rating

The power rating of electrical motors refers to the mechanical shaft output power (in opposite: for electrical generators the rating refers to the electrical power at the terminals.)
Within the IEC standard range (up to 315 kW) standardized values for the rating are defined
(e.g. 37 kW, 45 kW etc.).

1.2.2 Frame size

The frame size is defined as the distance [mm] between the mounting level and the centre of the shaft
(in case of floor mounted arrangement; accordingly a definition is stated for flange mounted arrangement).
Standard values for the frame sizes are defined for the IEC standard range (e.g. frame size 200, 225 etc.).
In addition a fixed coordination between power rating and frame size is defined in IEC 60072-1.
Within a defined frame size several types can be designed with different lengths.

1.2.3 Mounting arrangement

Rotating electrical machines can be delivered in a large variety of possible physical arrangements.
In IEC 60034-7 the construction and arrangement is classified, (IM code as e.g. “IM B3”).
Mechanical interface dimensions and their tolerances are standardized for each frame size.
Table of some typical arrangements:

Mounting	Code acc. IEC 60034-7		Description	
Diagram	Code I	Code II	Feet	Flange
Horizontal use:				
	IM B3	IM 1001	with feet	-
	IM B5	IM 3001	-	with flange (clearance fixing holes)
	IM B14	IM 3601	-	with flange (tapped fixing holes)

Mounting	Code acc. IEC 60034-7		Description	
Diagram	Code I	Code II	Feet	Flange
	IM B34	IM 2101	with feet	with flange (tapped fixing holes)
	IM B35	IM 2001	with feet	with flange (clearance fixing holes)
Vertical use:				
	IM V1	IM 3011	-	with flange (clearance fixing holes) shaft up
	IM V3	IM 3031	-	with flange (clearance fixing holes) shaft down
	IM V5	IM 1011	with feet shaft down	-
	IM V6	IM 1031	with feet shaft up	-

Table 1-2: Relevant IM arrangements (selection)

1.2.4 Construction and construction material

The relevant components are:

- Stator housing with active stator parts inside (magnetic core, stator winding),
- End shields with bearings,
- Shaft with active rotor parts (magnetic core, squirrel cage),
- Cooling system,
- Terminal box.

Housing, end shields and terminal box can be manufactured in aluminium (preferable at small machines), cast iron (medium size machines) or welded steel (large machines).

1.2.5 Cooling

Cooling can be carried out either with ambient air or with cooling water with a large variety of detailed constructions. Principle arrangements of the cooling are defined in IEC 60034-6 (IC code).
In the range of IEC standard motors as presented in this catalogue the cooling system in general is “IC 411”¨: Totally Enclosed Surface Fan cooled (“TEFC”) as shown in the sample picture above.

1.2.6 Degrees of protection

The level of protection against environmental conditions like water, dust, etc. is defined in 60034-5 (IP code as e.g. “IP55”). The user has to choose a sufficient degree of protection according to his environmental conditions.

1.2.7 Performance characteristics: Speed, torque

(Only induction motors with a rotor in “squirrel cage” design regarded here; no “wound rotor” types).
If operated at a grid with fixed voltage and frequency the nominal speed (“full load speed”) is near to the “no-load speed” (also called “synchronous speed”): this is defined by the grid frequency and the “pole number” of the motor (also called “2p” with “p” as the number of pole pairs):

Motor design	2-pole	4-pole	6-pole	8-pole
No load speed at 50 Hz grid	3000 rpm	1500 rpm	1000 rpm	750 rpm
No load speed at 60 Hz grid	3600 rpm	1800 rpm	1200 rpm	900 rpm

Table 1-3: No load speed

The starting performance is standardized by IEC 60034-12 (“Starting performance of single-speed three-phase cage induction motors”).
The motors covered by this catalogue comply with “IEC 60034-12, Design N”.
The typical characteristic of the torque versus speed is shown in the diagram below:

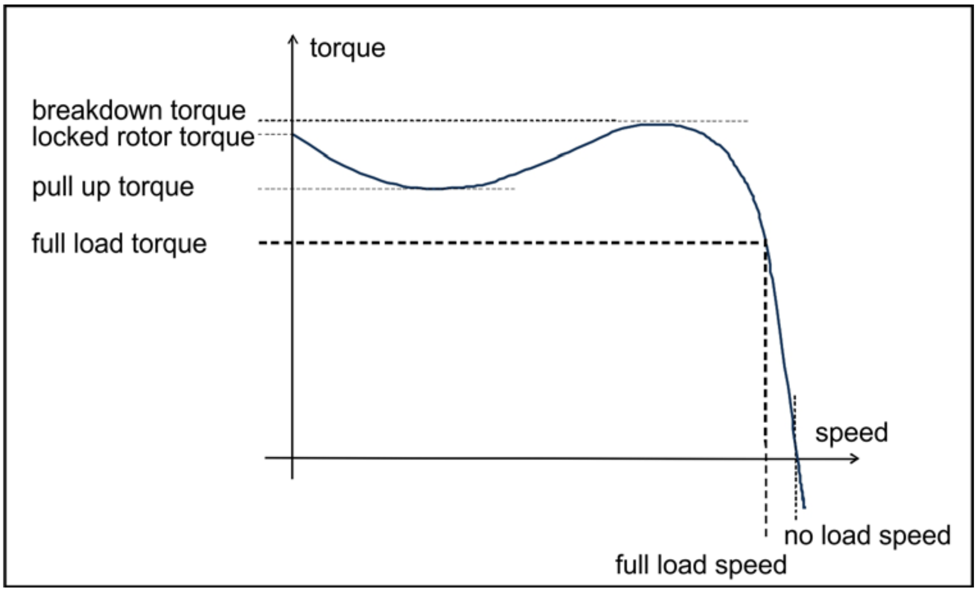

Figure 1-2: Typical characteristic for induction motors: Torque versus speed

Characteristic points which are content of the type data:

- Full load speed (“nominal speed”)
- Full load torque (“nominal torque”)
- Locked rotor torque (“starting torque”) ; as a multiple of nominal
- Pull up torque ; as a multiple of nominal
- Breakdown torque; as a multiple of nominal.

1.2.8 Electrical performance characteristics

According to 1.2.7 Performance characteristics: Speed, torque the typical characteristic of current and power factor is shown in the diagram below:

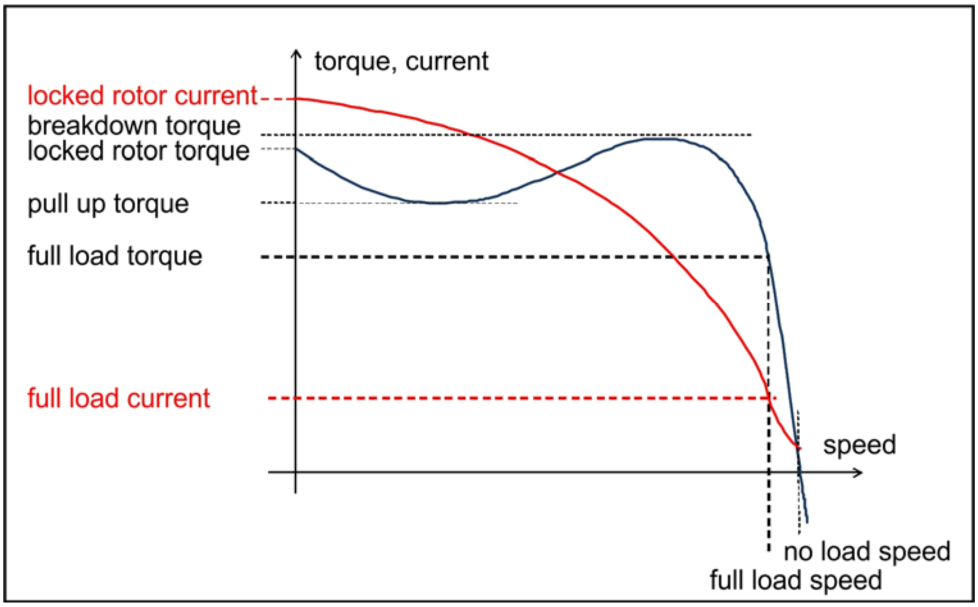

Figure 1-3: Typical characteristic for induction motors: Torque and current versus speed

Characteristic points which are content of the type data (see 6 Technical data, starting page 58):

- Full load current (“nominal current”)
- Full load power factor
- Locked rotor current; as a multiple of nominal.

At different load points (partial load, overload) the values for current, power factor and efficiency are varying; a typical characteristic is shown in diagram below.
The values of power factor and efficiency for each motor type are listed in section 6 for the load points 1/4; 2/4 and 3/4 partial load.

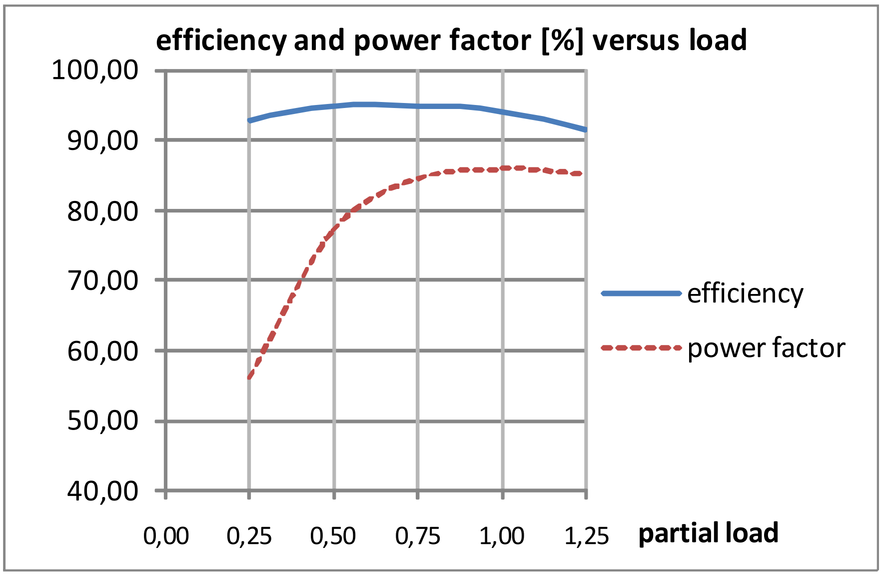

Figure 1-4: Typical characteristic for a TECO motor (30 kW): power factor and efficiency at partial load

2 AC Motors, European Design

2.1 Range of motors covered by this catalogue; variety of characteristics

Common characteristics	Three phase low voltage motors according to IEC standard, single speed, totally enclosed, for *Standard Safe Area*
Power rating	0,18 kW - 315 kW
Frame size	63 – 315
Pole number	2-pole; 4-pole; 6-pole; 8-pole
Line Frequency	50 Hz; 60 Hz
Type of mounting	Feet version, flange version and combinations
Construction material	Aluminium or Cast Iron
Efficiency class acc. IEC	Cast iron motors: IE2 and IE3 (identical dimensions) Aluminium motors: IE 2
Accessories	Standard or with options (e. g. forced ventilation)
Standards	IEC standards, European directives (CE marking). Compliance with additional regulations for applications “non essential service”: “GL Rules and guidelines 2011” “BV Rules and guidelines 2011” “LR Rules and Regulations for the classification of ships, 2011” “DNV Rules for Ships/High Speed, Light Craft and Naval Surface Craft, January 2011”

Table 2-1: Motors covered by this catalogue

2.2 TECO type code ("Motor Identification Code")

The type code is covering the overall range of TECO induction motors.
It is explained for a sample motor type "ALCA-0160MC-30004-IZ":
A low voltage 3 phase AC motor for application in "Safe Area", with aluminium housing; frame size 100; 4-pole; according IEC standards; optional version with accessories.

Type Key / Motor Identification Code / Type Code

	A	L	C	A	-	0	1	0	0	L	2	-	1	0	0	0	4	-	I	Z

34 Bearing
35 Pre-load spring
36 End shield NDE
37 Grease nipple
38 Grease drain cover
39 Outer bearing cover
40 Oil seal
41 External fan
42 Fan cowl

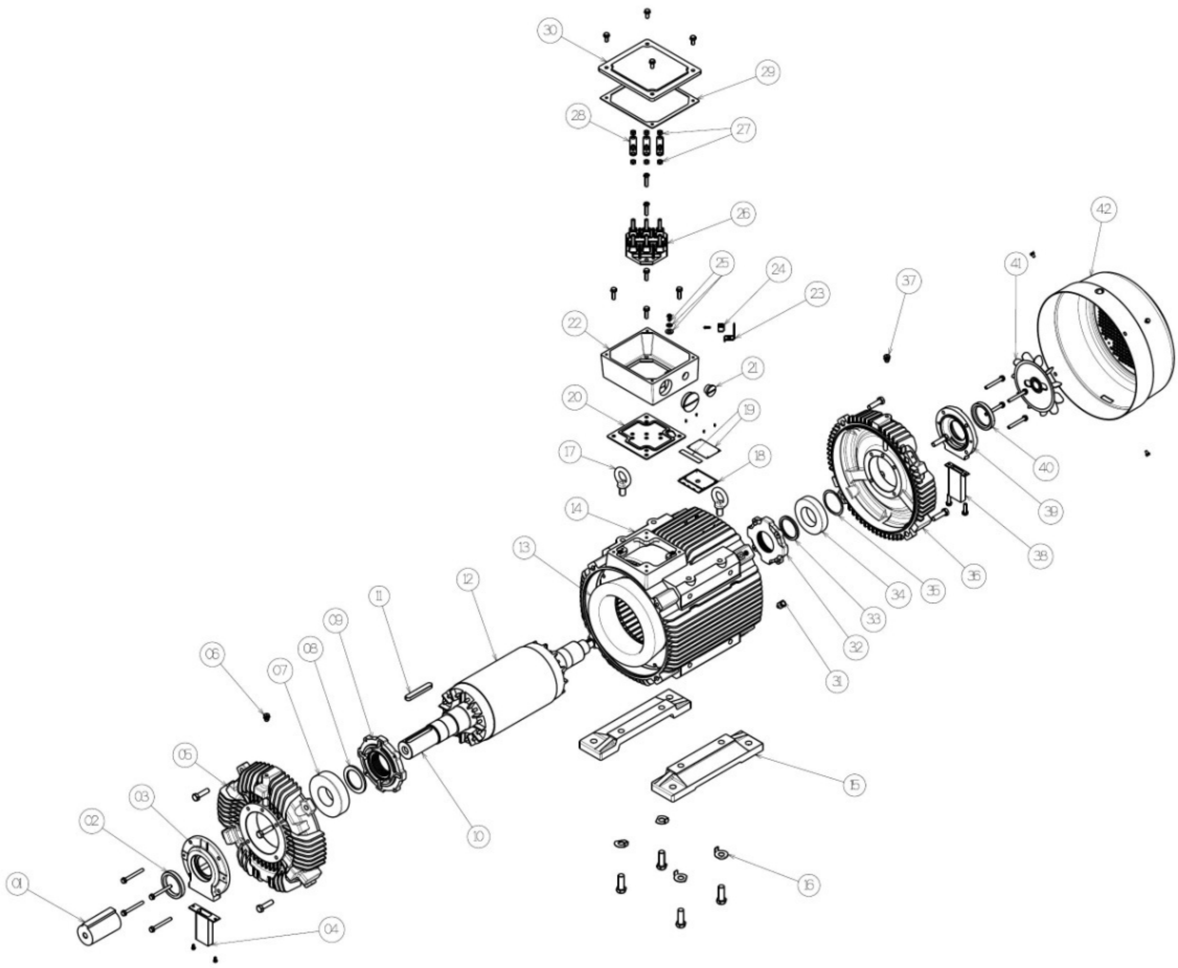

Figure 3-1: "Exploded" drawing of a sample TECO motor

The motors are available in the versions:

- Aluminium housing (type code e.g. “AL**A**A-......) or
- Cast iron housing (type code e.g. “AL**C**A-......).

Power ratings	Depending on pole number, see 6 Technical data, starting page 58.													
Frame size	**63**	**71**	**80**	**90**	**100**	**112**	**132**	**160**	**180**	**200**	**225**	**250**	**280**	**315**
Aluminium	X	X	X	X	X	X	X	X						
Cast iron			X	X	X	X	X	X	X	X	X	X	X	X

Table 3-1: Motor versions available

The motors can be delivered for many types of mounting:

- Feet version (IM code B3, suitable for arrangements B6, B7, B8, V5, V6); with top mounted terminal box (standard configuration)
- Flange version with clearance fixing holes (IM code B5, suitable for arrangements V1 and V3) or
- Flange version with tapped fixing holes (IM code B14, suitable for arrangements V18 and V19) or
- Version with feet and flange with clearance fixing holes (IM code B35, suitable for V15 and V36 or
- Version with feet and flange with tapped fixing holes (IM code B34).

  To be regarded only for motors with frame size 315; 2-pole:
  Vertical use (V- mountings) is only admissible in a special design; this has to be defined in the order.

Figure 3-2: Sample of a TECO motor (feet version)

Figure 3-3: Sample of a TECO motor (flange version)

Dimensions:
All external dimensions of the motor (shaft height, length) for a defined motor rating are identical for the IE2- and the IE3-version. This allows variability for the user depending on the application.
The dimensions and tolerances for the mechanical interface (e. g. positions of feet holes) are defined by IEC 60072-1.

Multi-mount symmetric design - Axial direction:
The motor housing is designed to allow for a large variety of mounting arrangements.
It is symmetric in axial direction (DE – NDE), except of the asymmetric position of the terminal box.
Therefore the user can change the axial position of the terminal box according to the individual spatial conditions at his construction (front or back) by changing the position of the rotor including DE and NDE end shield. Due to a special design of the DE end shield this modification can be carried out without dismantling the NDE assembly.
(To be regarded when carrying out this modification: the rotational direction of the motor is no longer acc. to IEC 60034-8 then. Precautions shall be made to prevent disturbances.
Modification of mounting arrangement shall only be carried out by qualified personnel; regard the guidelines in the TECO manual “INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS....”)

Figure 3-4: Multi- mount design (in axial direction); terminal box “Drive End”

Figure 3-5: Multi- mount design (in axial direction); terminal box “Non drive end”

SDF
As a standard the “feet”- in SDF version (B3; B34; B35) are delivered with a top mounted terminal box.
In the “Standard Detachable Feet” (SDF) version; the feet can be detached if required.

ADF
In the optional version “Advanced Detachable Feet; (ADF) the housing is machined to be able to move the feet in 3 x 90° positions. Therefore the feet can easily be mounted in each of the 3 rotational positions and the 2 axial positions.
All surfaces and all fixing holes for mounting the feet are machined, drilled, tapped and plugged. The holes (as well as others e.g. for lifting lugs, etc.) are designed as blind holes.
If using the original feet a change of the feet position is possible without new alignment of the motor when feet are fixed in the new position.

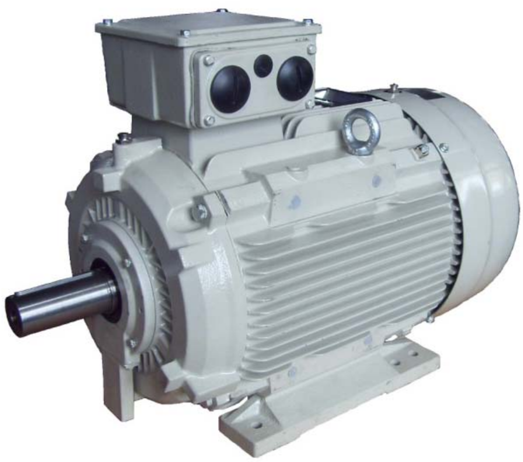

Figure 3-6: Multi-mount design (top mounted terminal box)

Figure 3-7: Multi-mount design (terminal box in left hand side position)

Figure 3-8: Multi-mount design (terminal box in right hand side position)

Details for flange version
Possible mounting arrangements according to IEC 60034-7: B5, V1, V3.
All customer interface dimensions (hole circle diameter, centring diameter, etc.) and their tolerances are defined by IEC 60072-1.
For a number of motor frame sizes as an option flanges with external dimensions equivalent to larger or smaller frame sizes are available on request; see tables:

Table 3-3: Flange sizes available (B14; tapped fixing holes)

3.2 Terminal box and cable entry

As a standard the motors are delivered with a top mounted terminal box; located at the drive end, with cable entry to the right hand side.
As described in 3.1 Housing, mounting arrangement, the position of the terminal box can easily be varied (left, right, front or back).
Furthermore the terminal box itself is able to be rotated by steps of 90° to every direction to enable power cable entry from 4 directions (front, rear, left, right).
(Guidelines for proper modification of the terminal box position: see TECO manual “INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS....”)

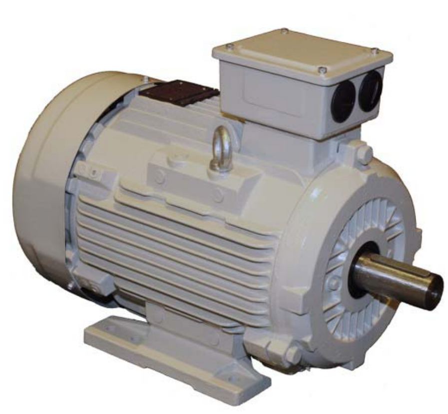

Figure 3-9: Cable entry front

Figure 3-10: Cable entry back

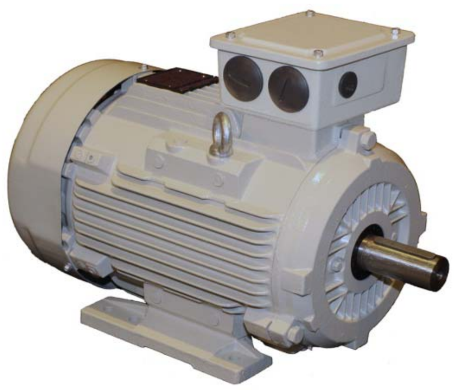

Figure 3-11: Cable entry left

Figure 3-12: Cable entry right

There are two cable entry holes for the power supply cable(s) and one entry hole for the cable for auxiliary devices, e. g. for thermistor connection. They are drilled, tapped and properly sealed; with threads according to table below.
(The applicable cable outer diameter is dependent on the customer's cable gland type.)

All six winding lead ends from the windings are brought out and connected to a terminal block with metric threaded bolts for smaller motors or to metric duct connection bolts for bigger motors.
Screws and nuts are hexagonal with metric thread and with ISO wrench sizes acc. to DIN EN ISO 4014 (screws) and DIN EN ISO 4032 (nuts).
Three jumpers are attached to enable the customer a simple star or delta connection (see 4 Electrical design, starting page 37).

The lead ends of the standard thermistors (as well as optional accessories like space heaters) are connected to terminals (luster terminals or spring loaded serial terminals, see table below).

The terminals are marked and directed according to IEC 60034-8
A connection diagram sticker with the wiring diagram is fitted on the inside of the terminal box lid.

ALAA, cable entries for power and thermistors:

Frame size	Power Supply		Thermistor	
	Threads	**Power connector bolts**	**Threads**	**Type of Connector**
63	2 x M16 x 1.5	U-clamp		Luster terminal
71	2 x M16 x 1.5	U-clamp		Luster terminal
80	2 x M16 x 1.5	U-clamp		Luster terminal
90	2 x M25 x 1,5	U-clamp		Luster terminal
100	2 x M25 x 1.5	U-clamp		Luster terminal
112	1 x M32 x 1.5	U-clamp	1 x M25 x 1.5	Luster terminal
132	1 x M32 x 1,5	U-clamp	1 x M25 x 1.5	Luster terminal
160	2 x M40 x 1,5	Bolts	1 x M20 x 1.5	Serial terminal

ALCA, cable entries for power and thermistors:

Frame size	Power Supply		Thermistor	
	Threads	**Power connector bolts**	**Threads**	**Type of Connector**
63	1 x M20 x 1.5	U-clamp	M16 x 1.5	Luster terminal
71	1 x M20 x 1.5	U-clamp	M16 x 1.5	Luster terminal
80	2 x M25 x 1,5	U-clamp	M20 x 1.5	Luster terminal
90	2 x M25 x 1,5	U-clamp	M20 x 1.5	Luster terminal
100	2 x M32 x 1,5	U-clamp	M20 x 1.5	Luster terminal
112	2 x M32 x 1,5	U-clamp	M20 x 1.5	Luster terminal
132	2 x M32 x 1,5	U-clamp	M20 x 1.5	Luster terminal

315	2 x M63 x 1,5	Bolts	M20 x 1.5	Serial terminal

Table 3-4: Cable entries and connectors

Detailed mechanical dimensions depending on motor type: see 7 Outline drawings, starting page 82.

Options, on request:

From frame size 160 to 250 an optional attachment of one and from frame size 280 to 400 of two separate accessory terminal boxes is available.
(e.g.: different terminal boxes for different voltage levels may be demanded by customer specifications).

The motors can also be delivered without a terminal box on request. In this case we provide a blind plate with bushing for direct entry of customer specified cable(s).

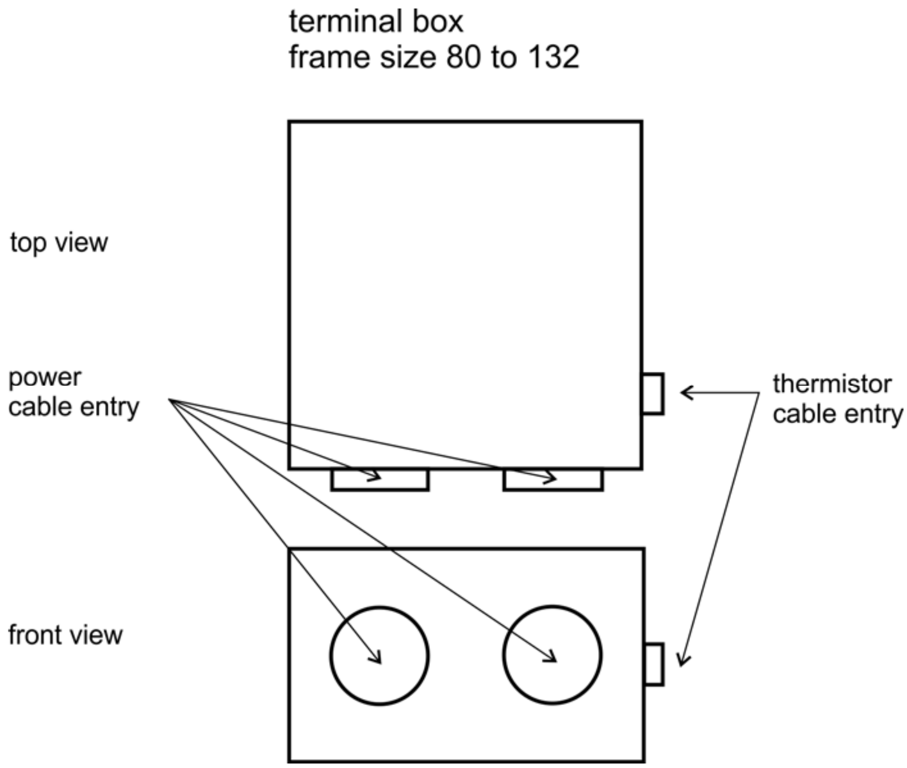

Figure 3-13: Position of cable entries (up to frame size 132)

Frame size 160 and above are equipped with a detachable steel plate on one side of the terminal box (cable entry plate). This is to enable customers an easy power supply connection and simple replacement of the motors with bulky cables as well as for later flexibility if customer asks for special amount of cable entry holes with special threads (special cable size or number of cables).

In these cases TECO can manufacture customized entry plates or blank plates on demand.
Customer's cable glands: Insure the cable glands used are rated to an equal or better protection class than the motor.

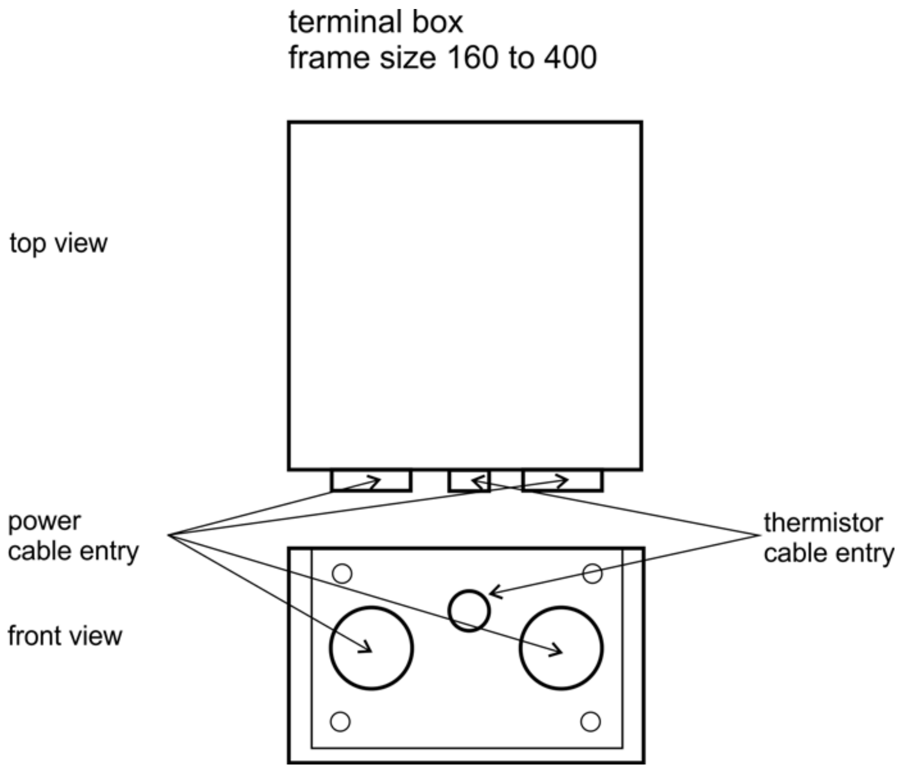

Figure 3-14: Position of cable entries (ALCA, frame size 160 to 315)

Figure 3-15: Detached entry plate

3.3 Cooling

As a standard the motors covered by this catalogue are “Totally Enclosed Surface Fan Cooled” (“TEFC”) acc. to the IEC code “IC 411”.
This design provides cooling fins on the surface of the motor housing and a fan (and fan cowl) at NDE to generate a cooling air flow over these fins from NDE to DE.
Even though acoustic noise is optimized, the fan is suitable for application in both directions of rotation (“bidirectional design”).
The fan cowl is manufactured in steel sheet.

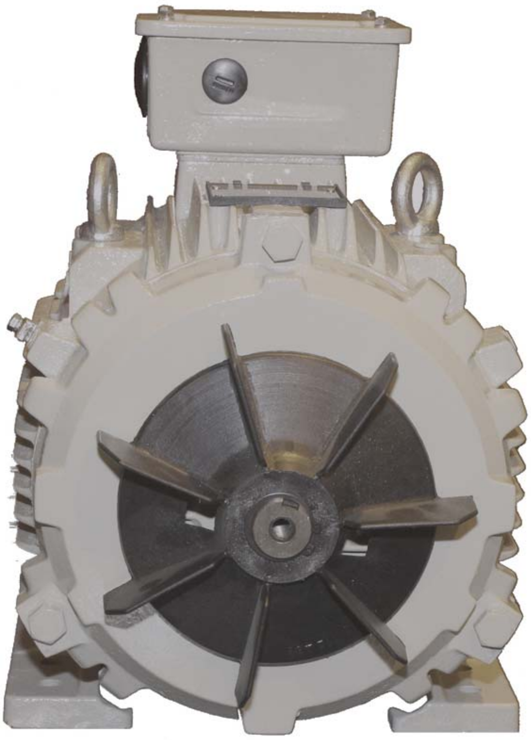

Figure 3-16: Cooling principle (“TEFC”)

In accordance with IEC standards the degree of protection for the cooling system is IP 20 (even though the motor is classified in a much higher degree of protection, in this case IP 55).
The cooling system allows operation in any mounting position in principle. When mounted in a “shaft down position” precautions are required to prevent foreign bodies or excessive amount of water falling into the openings of fan. An accessory kit “Protection cover for shaft down motors” is available on request; it can be added easily in site.

The user has to take care that the air flow is not hindered or a high back pressure is generated when integrating the motor into his machine. As a general rule e.g. the distance between air inlet of motor and obstruction should be at least ¼ of the air inlet diameter of the fan cowl.

Options:

- A special design with “uni- directional” fan for acoustic noise reduction is available on request. In this case a sticker is mounted at the top of the front end shield which clearly indicates the direction of rotation.
  (acoustic noise level: see 5.3 Mechanical performance, starting page 42.
- Especially for frequency inverter operation (high speed or low speed range) a “Forced Ventilation” can be installed as an option. The fan then is operated by an additional motor to provide constant cooling independent from the main motor’s speed.

  For special applications the motors can be delivered without ventilation. Power rating and duty type then have to be calculated by TECO acc. to customer’s request.

3.4 Rotor assembly (active part, shaft, bearings)

3.4.1 General

The active rotor part of a squirrel cage motor is a rugged arrangement only consisting of the magnetic lamination and the short circuit “winding” made of cast aluminium.
It is mounted on the shaft manufactured from high tensile strength carbon steel.
The bearings (including sealing) are supported in the end shields (aluminium or cast iron, according to motor type).

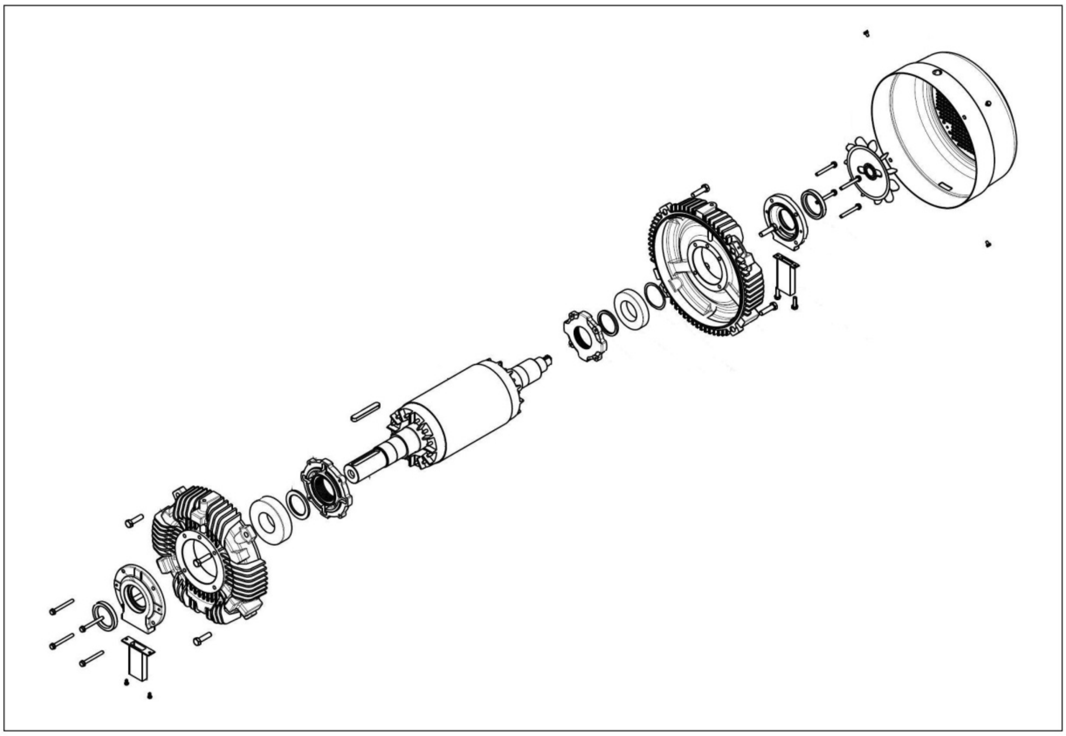

Figure 3-17: Rotor assembly (active part, shaft, bearings, end shields, fan)

The rotor is dynamically balanced with half key and the shaft end face is marked according to standard DIN ISO 8821 ("H" = half key).
The balance quality meets DIN ISO 1940, Q2,5.
The mechanical vibrations of the motors meet level A according to EN 60034-14 at synchronous speed
Mechanical vibrations; permissible axial and radial forces at DE and maximum mechanical speed:
Se 5.3 Mechanical performance, starting page 42.

3.4.2 Shaft

The dimensions of the DE shaft end (including the keyway) and their tolerances are standardized by IEC 60027-1 (DIN EN 50347). The DE shaft face has a threaded centre hole for mounting of customer's shaft fitments.
(Guidelines for proper coupling and alignment: see TECO manual "INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS...."
The key is press fit into key way.
The NDE shaft end is carrying the fan; on larger machines (see dimensional diagrams.
Depending on frame size its face is equipped with a threaded centre hole for later mounting of accessories (like speed sensor, etc.). The fan is manufactured from conductive polypropylene (non-sparking material).

3.4.3 Bearings

As a standard both DE bearing and NDE bearing are ball bearings, suitable both for horizontal and vertical mounting of the motor (except for frame size 315, 2-pole; where a special bearing is provided for operation at vertical mounting, see tables below).
As an option reinforced bearing types can be provided according to customer's load specifications.
The DE bearing is fixed; it absorbs axial and radial forces transmitted from the driven machine. The floating bearing is installed at the non drive end (NDE) to allow thermal expansion of the shaft and to absorb radial forces. The bearings are preloaded in axial direction by an undular washer at NDE.
Even though the DE bearing is fixed due to a special design of the DE end shield it is easy to fit a flange end shield without removing the rotor. Disassembling of the rotor (e.g. for changing the terminal box position) can be carried out without disassembling the NDE).

Motors up to frame size 160 are equipped with double shielded bearings (suffix "zz" on bearing type). Those motors bearings are lubricated for life. They are maintenance- free and cannot be regreased.

Motors from frame size 180 up to frame size 315 are equipped with grease nipples both at DE and NDE for manual regreasing. These motors are already greased during manufacture.
Grease nipples are of "flat button head" design according to DIN 3404 with thread M10x 1.
DE and NDE nipple are easily accessible (NDE nipple outside of the fan cowl).

Table 3-7: Bearings used in cast iron motors (type code: AL<u>C</u>A....), frame size 180 up to 315

Bearing lifetime:
The calculated operating life L10 of the bearings is at least 20000 hours, provided:
- operation in horizontal position
- operation at nominal max temperature and nominal speed
- radial and axial forces are within the limits stated in the catalogue, ee 5.3 Mechanical performance, starting page 42.

In case of operation with a coupling (no additional axial or radial forces from the driven machine) a lifetime of 50000 h is calculated.
Lifetime is reduced when operated at increased ambient temperature higher speed than nominal or under severe vibration conditions.

Tables for calculated operating lifetime:

Frame size	Lifetime at nominal operational conditions			
	2-pole	4-pole	6-pole	8-pole
	[h]	[h]	[h]	[h]
63	20000	40000	40000	40000
71	20000	40000	40000	40000
80	20000	40000	40000	40000
90	20000	40000	40000	40000
100	20000	40000	40000	40000
112	20000	40000	40000	40000
132	20000	40000	40000	40000
160	20000	40000	40000	40000

Table 3-8: *Calculated lifetime for sealed standard bearings (operating life L10)*

Sealing:
The sealing of DE and NDE bearing is provided by a radial seal ring with dust protection lip to fulfil the requirements of degree of protection “IP 55”.
IP56 or IP65 protection options (dust tight; protection against powerful water jets) can be realized by reinforced sealing (see 3.4.3 Bearings, starting page 28).
For applications with direct gearbox mounting an option “Oil Sealed Design” is available.

Bearing insulation:
If the motor is line operated (sinusoidal voltage supply) motors covered by this catalogue usually do not need a bearing insulation, because the shaft voltage (caused by small magnetic unbalance within the machine) does not exceed the level of 500 mV. This level is agreed as a save limit in the standard IEC 60034-17.
If the motor is inverter operated, increased bearing stress by high frequent bearing currents might occur.
As an option TECO recommends using insulated bearing on NDE for frame size 280 and above in this case
(see 5.5 Motor performance (inverter operated), starting page 51).

3.4.4 Regreasing

(relevant for cast iron motors, frame size 160 – 315)

Frame size	Regreasing intervals at nominal operational conditions [h], grease quantity per bearing [g]

Table 3-10: Regreasing intervals and grease quantity for motors with reinforced bearings; for nominal operation conditions at 50 Hz (data for motors operated at 60 Hz are available on request).

The grease must be replaced at regular intervals depending on the motor size and its usage.
The used grease exits through a grease drain.
Regreasing intervals and grease quantity: see tables Table 3-9 and Table 3-10 and regreasing labels on the motor.

Regard that greasing intervals are given for operation at rated speed, nominal operation conditions and for horizontal mounting position. In case of vertical use the intervals shall be reduced to 50%.
In case of ambient temperature higher than 40°C or when operated with higher speed than nominal the intervals have to be reduced according table below:

Ambient temperature	+ 40°C	+ 50°C	+ 60°C
Recommended reduction of regreasing intervals	1	0,6	0,4

continuous speed	nominal	1,5 x nominal	2 x nominal
Recommended reduction of regreasing intervals	1	0,6	0,5

Table 3-11: Rule of thumb for reduction of regreasing intervals

Details (grease type, recommendations for greasing procedure) can be seen on additional regreasing nameplates (close to the regreasing nipples) and the TECO manual "INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS".

3.5 Degree of protection

The IEC classification system IEC60034- 5 defines the protection against external influence, e.g. degree "IP 55".
The first numeral describes the protection of people against contact with live parts and rotating parts and the protection against ingress of dust.
The second numeral defines the protection against ingress of water.

As a standard the motors comply with degree IP 55; this describes:
- The machine is completely protected against contact with live or rotating parts. Ingress of dust is not totally prevented, but dust does not enter in sufficient quantity to interfere with satisfactory operation of the machine.
- The machine is protected against water jets. Water projected by a nozzle against the machine from any direction has no harmful effect.
  (Remark: Restrictions concerning fan, degree IP 20, and the shaft end are covered by standards).

  This allows the operation of the motor in a rough environment.
  In outdoor application the motor shall be protected against excessive solar radiation.
  The motors are intended for use in a "Safe Area". Operation in "Hazardous Area" is not permitted.

Opionally IP 56 or IP 66 (dust tight; protection against powerful water jets) can be realized by reinforced sealing (see 3.4.3 Bearings, starting page 28).

3.6 Others

3.6.1 Grounding terminals

The grounding terminals are directly screwed into the motor frame and have no other function except of grounding, they comply with .EN 60 204-1. Screws, washers and U-clamps are made of electro-zinc plated steel.
They are labelled with the ground symbol defined in DIN EN 60 617-2:

One terminal is located inside of the terminal box.
The stator housing provides 4 external access points for grounding to allow easy access in every possible mounting position.
The assembled grounding access point shall be free of primer or paint and shall be metallic blank.
Only 1 access points is finally assembled ex factory (right hand side).

Design examples for grounding terminals:

a) for motors frame size 80 … 250
b) for motors frame size 280 and larger

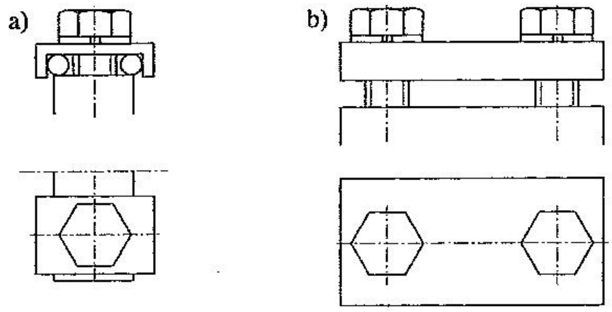

Figure 3-19: Design examples for grounding terminals

3.6.2 Lifting eyes

Using the lifting eye(s) is obligatory when transporting and lifting the motor; details see TECO manual “INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS ....”.
The position of the lifting eye(s) can be seen in the sample figure below and in section 7 Outline drawings, starting page 82.
In case of 2 lifting eyes (frame size 132 and larger) both of the 2 lifting eyes have to be used. They are located in a way that there is no collision with already installed power cables installed in axial direction.

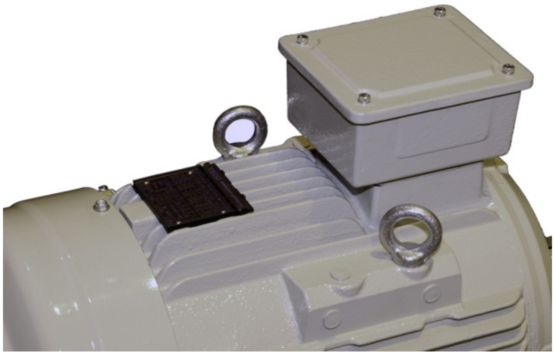

Figure 3-20: Position of lifting eyes

3.6.3 Drain holes

As a standard no drain holes are provided.
Drain holes can be drilled on customer's request for frame size 132 and larger. They will be located in the brackets or flanges and not in the housing to allow later modifications of the mounting arrangement.

3.6.4 SPM provision

Drilled, tapped and plugged holes with conical M8 thread for later shock pulse measurement nipple mounting on DE and NDE are provided for frame size 280 and above.

3.6.5 Painting, corrosion protection

Concerning corrosion the top coat is resistant to water, steam and salt water. Concerning chemical surrounding the top coat is resistant to hydraulic liquids, cleaning agents, synthetic coolants, solvents and chemicals. The coating is appropriate for a temperature range from -40°C to +130°C; it stays nonabrasive, elastic, scratch resistant and impact resistant through the whole temperature range.
The motors are suitable for use in paint shops and are 100% free of paint adhesion detrimental substances as for example silicone.
Layer thickness see figure below.

	Cast iron, frame size ≤ 132 Aluminium motors ≤ 160	Cast iron, frame size ≥ 160
Primer for cast iron parts	min. 20 µm	min. 25 µm
Primer for aluminium parts	min. 20 µm	-
Primer for steel parts	min. 20µm	min. 25 µm
Base prior to top coat	min. 20 µm	min. 50 µm
Top coat *	min. 20 µm	min. 25 µm
Total thickness of coating	min. 60 µm	min. 100 µm
*) The inner surface of the fan cowl is treated with primer only		

Table 3-12: Layer thickness of painting

As a standard the motor frame and fan cowl colour is grey (RAL 7032, pebble grey). For later customizing of the motor it is possible to spray a second layer of top coat (same thickness as standard coating) without influence to the thermal design of the motor.

All machined and metallic blank surfaces (feet, flange, 1 external grounding surface, shaft end) are protected against corrosion. The antirust agent can stay at the parts without influence to customer assembling (coupling) or mounting the motor to machine (max. layer thickness 5 µm).

3.6.6 Rating plate and labelling

The material of the rating plate is stainless steel and the data indicated are irremovable and clearly engraved or lasered. It is irremovably fixed (riveted) at the motor frame.

Rating plate data comply with IEC 60 034-1 and contain e.g. (see sample below):
- name of manufacturer
- serial number (a unique individual identification number) and year of construction
- reference to IEC standard
- efficiency level (efficiency class IE-code according to IEC 60 034-30)
- the CE marking
- technical data according to IEC 60 034-1.

The Rating plate is split into 2 sections, mounted on a common plastic base plate.
The plastic base plate and the main section (bottom) of the rating plate are riveted to the motor frame.
The upper section is solely wearing the manufacturer's brand and is clipped into the plastic base plate.
As a standard it will carry the TECO-Brand; optionally with customer's brand instead.
For original equipment manufacturers it is possible to remove the original brand plate easily and to clip an individual brand plate into the plastic base plate in site.

Figure 3-21: Sample of a TECO rating plate

Additional nameplates and markings:

- Connection diagram sticker with the wiring diagram, fitted on the inside of the terminal box lid
- In case of optional accessories: connection diagram sticker inside terminal box
- Grounding symbols according to DIN EN 60617-2
- Incase of regreasable bearings: regreasing nameplates (close to the regreasing nipples)

4 Electrical design

Squirrel cage motors as covered by this catalogue provide electrical active parts:

- **Rotor**
  The active part is a rugged arrangement only consisting of the magnetic lamination and the short circuit “winding” made of cast aluminium embedded in slots.
- **Stator**
  Contains the magnetic stator lamination, the three phase winding embedded in slots; including its insulation system and integrated temperature sensors.
- **Terminals**

4.1 Stator winding

The stator winding is carried out as a wire wound winding (“random winding”). High quality enamelled wires are used. Insulating sheets provide proper performance for

- insulation **phase to ground,**
- **insulation phase to phase and**
- **interturn insulation.**

An appropriate phase separation and a proper bandage of the winding overhang ensure high electric and mechanical strength.
The stator winding is rotating dip impregnated with varnish or resin according to “thermal class F” requirements. According to the classification EN 60085 thermal class F allows a maximum hot spot temperature of 155°C.
TECO motors covered by this catalogue are utilized (under nominal conditions) according to class “B”: - average temperature rise (by resistance method) is 80°K;

- **maximum spot temperature is 130°C**.

This ensures a high lifetime of the insulation system.
(Insulation does not suddenly fail if the maximum temperature of the thermal class is reached, but useful operating life declines rapidly. A rule of thumb is a halving of life time for every increase of 10°C.)
As an option an additional finish for tropical protection (against fungus) can be provided (option “Tropical Climate Proof”).

Figure 4-1: Stator core with slot liners

Figure 4-2: Stator core with winding

The winding features 3 phases which produce the rotating magnetic flux.
All 6 winding ends are connected to the terminal box.
The 3-phase line can be connected to the winding either in star connection (written as “Y”) or delta connection (written as “D” or Δ), see figure below:

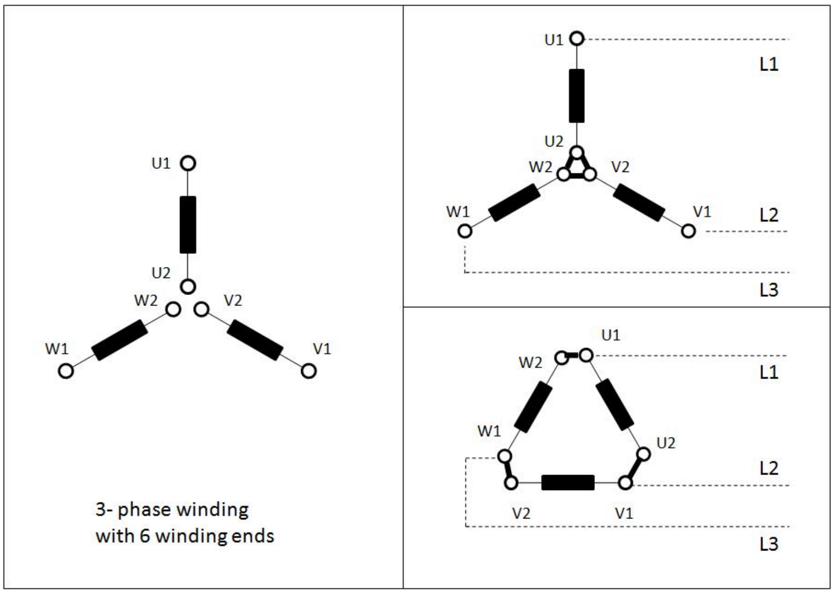

Figure 4-3: Three phase stator winding (star and delta connection)

These configurations allow operation of a certain motor at a higher line voltage level (e.g. 690 V with “star” connection) or at a lower line voltage (e.g. 400 V with “delta” connection).
In case of dual rating: The rating plate is providing data for both applications
(e.g.: “400 V/690 V D/Y; 129,4 A/75 A”).

If the standard configuration of the motor for nominal voltage is designed as “delta” (preferred at higher power rating) the motor might be switched to “star” during starting by an external switchgear. This allows reduction of starting current (factor √3) and starting torque (factor 3).
The TECO standard configuration is shown in the table below:

Power rating [kW]	Line frequency [Hz]	Nominal voltage [V]; connection
≤ 2.2	50	230 V Δ / 400 V Y
	60	265 V Δ / 460 V Y
≥ 3.0	50	400 V Δ / 690 V Y
	60	460 V Δ

Table 4-1: TECO standard winding configuration and nominal voltage(s)

The configuration can be carried out by the user by inserting the jumpers of the terminal box; the spatial arrangement is shown in the figure below (standard sticker inside of the terminal box):

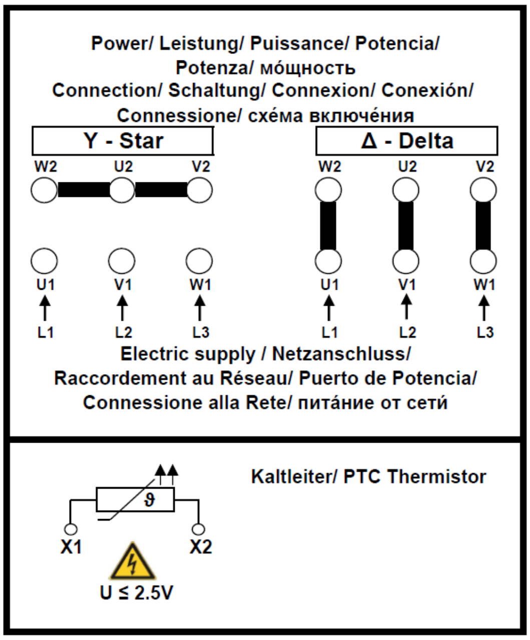

Figure 4-4: Arrangement of connection bolts and jumpers for star/delta connection

Phase sequence:
If the terminals are connected to an electrically clockwise supply system the motor is designed for clockwise mechanical rotation (when viewing from driving shaft end; according to IEC 60 034-8).
For change of rotational direction a change of 2 supply line phases has to be carried out by customer.

4.2 Thermal protection

For thermal protection of the winding as a standard 3 temperature PTC thermistors are embedded in the winding; one for each phase (acc to standards IEC 60 034-11 and DIN 44081).
Their nominal temperature level is 150°C; when reaching this temperature their resistance suddenly escalates to a high level. They are connected in series and lead to terminals in the terminal box. A suitable monitoring device according to standard DIN 44081 shall be connected by customer and shall be used for tripping the system.
At inverter operation the use of this method of thermal protection is mandatory; protection measures based on operating current are not suitable in this case.
A warning on the sticker inside the terminal box shows that no voltage higher than 2,5 V must be applied on these terminals.

5 Performance data

5.1 Duty type

The motors are designed for continuous operation at full load under nominal ambient conditions (duty type “S1” according to IEC 60034-1.
Type data for differing duty types (S2 ... S8, periodic variation of load, influence of frequent starting stress, etc.) and S9 (non-periodic load and speed variation, e.g. at inverter operation) can be evaluated on request.

5.2 Environmental conditions, performance

All environmental conditions in site as listed in standard IEC 60721-3 (temperature, altitude, exposition to water, biological, chemical and mechanical active substances, vibrations, etc. have to be in accordance with the design of the motor (e.g. degree of protection).

5.2.1 Operation at high ambient temperature /high altitude

As a standard the motors are designed for
- ambient temperature (cooling air temperature): -20°C up to + 40°C
- maximum altitude 1000 m above sea level

The motors can also be operated at higher ambient temperatures or at higher altitude if the continuous output power is reduced, see figures below. In this case the winding temperature rise is approximately identical to nominal operation.
It has to be regarded that the bearing stress at higher temperature is increased and regreasing intervals shall be shortened accordingly then (see 3.4.3 Bearings, starting page 28).

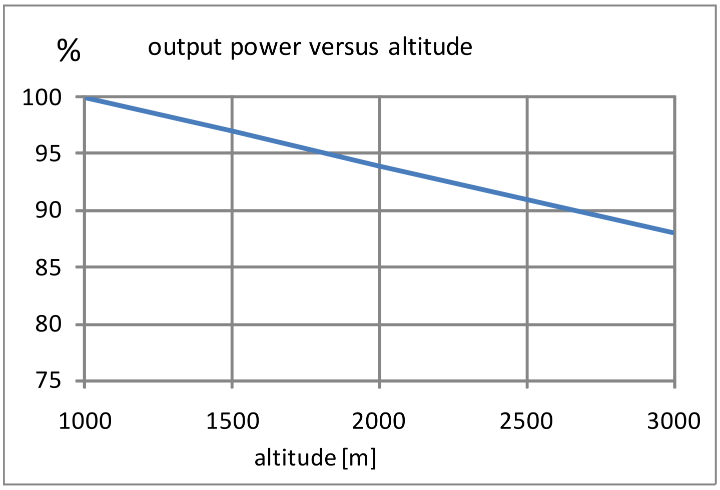

Figure 5-1: Reduction of output power versus ambient temperature

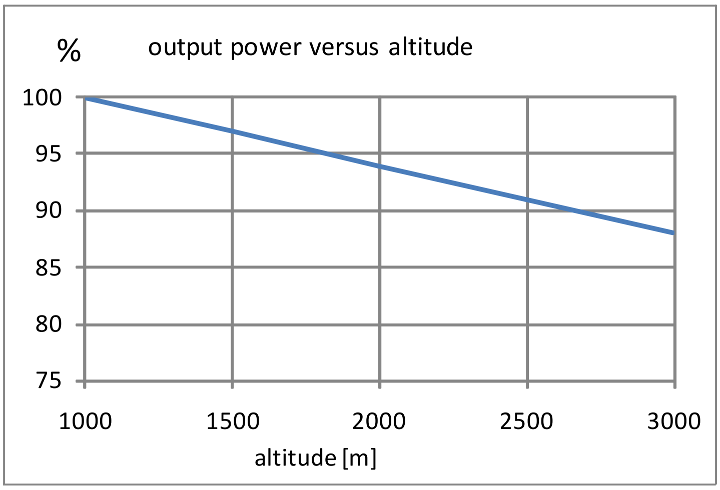

Figure 5-2: Reduction of output power versus altitude

Output with nominal power rating is permissible at high altitude, if accordingly the ambient temperature is reduced, see figure below:

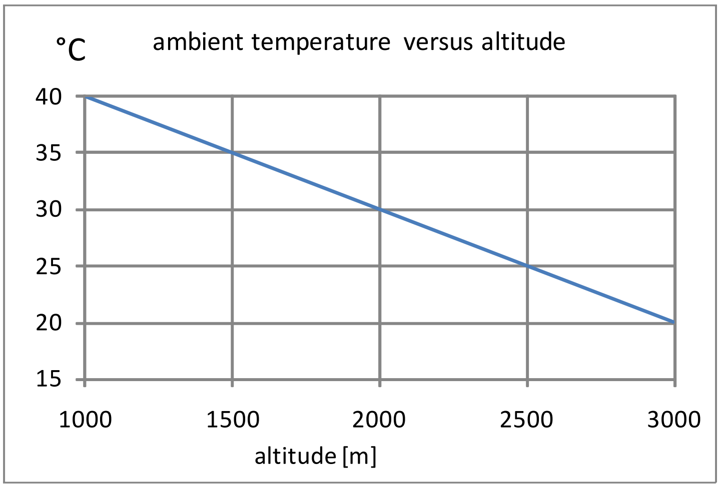

Figure 5-3: Reduction of ambient temperature versus altitude for nominal output rating

5.2.2 Operation at low temperature /high humidity

For operation at ambient temperature range -20 °C to -40 °C a heater for the motor winding is necessary at standstill. The same precaution is requested for operation in sites with normal temperature level, but high humidity (typically above 90%) to prevent condensation inside the motor.

Heating can be carried out:

- By accessory "Heating via strip heater"
  In this case additional terminals for the heater are provided within the terminal box. Heater terminals are marked with a voltage flash and a short note "Heater may be energized even if motor is isolated!" A special connection diagram sticker with the wiring diagram of the accessory is fitted inside terminal box lid.
  Approx. heater power see Table 5-1, page 42.
- By heating the motor via stator winding. An auxiliary single phase AC voltage supply is to be connected to 2 power connectors. The appropriate voltage level and VA- rating depending on the motor size: On request.

The safety precautions as mentioned above have to be regarded by the user.

	To prevent condensation					For ambient temperature -20°C to - 40°C				
Frame size	Heater output [W]	Heater nominal voltage single phase AC [V]				Heater output [W]	Heater nominal voltage single phase AC [V]			
		230	400				230	400		
63	10	10	10			10	10	10		
71	10	10	10			10	10	10		
80	20	20	20			20	20	20		
90	20	20	20			20	20	20		
100	30	30	30			30	30	30		
112	30	30	30			30	30	30		
132	40	40	40			40	40	40		
160	40	40	40			40	40	40		
180	50	50	50			50	50	50		
200	50	50	50			50	50	50		
225	60	60	60			60	60	60		
250	60	60	60			60	60	60		
280	150	150	150			150	150	150		
315	200	200	200			200	200	200		

Table 5-1: Availability and output power of option "Heating via Strip Heater"

5.2.3 Operation at severe mechanical conditions

For operation at extraordinary mechanical conditions (permanent exposure to vibration and shock higher than class 3M3 acc. to IEC 60721-3) we recommend a special request.

5.3 Mechanical performance

5.3.1 Torque characteristic; starting performance

The power rating (nominal power P_N) and the nominal torque (T_N) of each type is listed in
6 Technical data, starting page 58.
The torque can be calculated in general as:

$$T = \frac{9550 \times P}{n}$$

where T = torque [Nm]
P = power [kW] and
n = speed [rpm].

The motors are equipped with a squirrel cage rotor (cast aluminium); they are suitable for direct starting. Direction of rotation is clockwise (view onto shaft end) if a clockwise supply system is connected according to the wiring diagram. Technical data of the standard motors are valid for both directions of rotation (bidirectional design).
In IEC 600034-12 the starting performance is standardized.

During starting the motor creates a torque according to its individual characteristic (locked rotor torque, pull up torque and break down torque as generally described in 1.2.7 Performance characteristics: Speed, torque, starting page 11). Depending on the type an individual value for the torques is listed in 6 Technical data, starting page 58.
A sample of a TECO type test see figure below.
In steady operation at full load torque the individual nominal speed (close to no load speed) is reached. It has to be regarded that this speed is only valid for thermal equilibrium conditions. If the motor is not heated up this speed will be significant closer to the no load speed.
Limits and tolerances according to IEC standard: see 6.1 General data; tolerances (acc. to IEC 60034-1), starting page 58.
According to requirements of IEC 60034 the break down torque (including -10% tolerance) has to be 160 % at least.
The torque values are quadratic depending on a variation of line voltage. (Correspondingly the complete torque characteristic e.g. is reduced by a factor of 3 when starting the motor in star-delta).

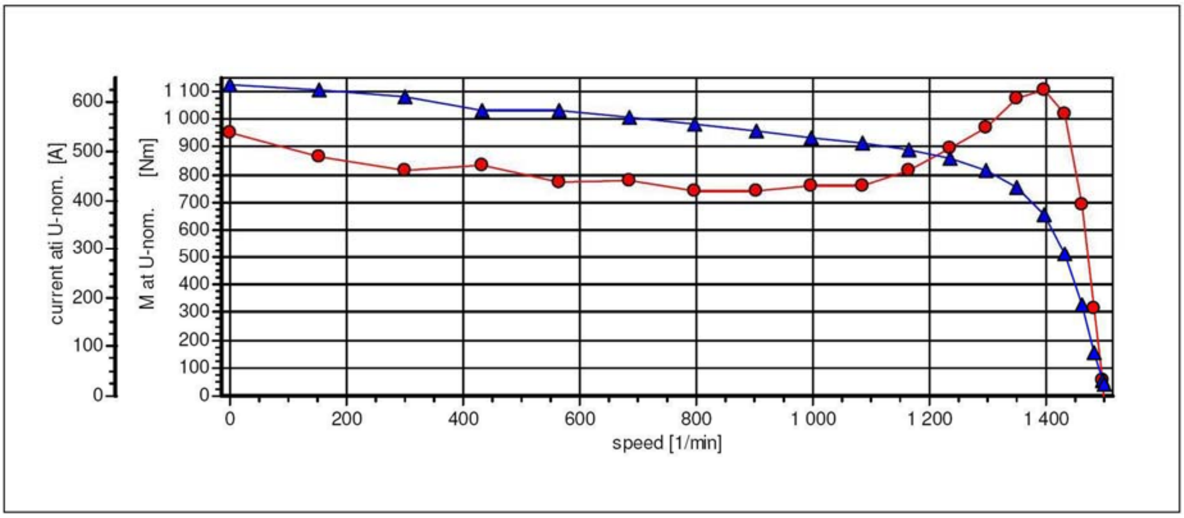

Figure 5-4: Sample of TECO type test data sheet: Torque and current vs. speed

5.3.2 Maximum operational speed

It is possible to increase the speed e.g. by feeding the motor from a frequency inverter with increased frequency. In general it shall be regarded at increased speed (also see 5.5 Motor performance (inverter operated), starting page 51):
- increase of acoustic noise level (especially contribution of fan noise)
- increase of vibration
- regreasing intervals shall be shortened accordingly then (see 3.4.3 Bearings, starting page 28)
- bearing life may be reduced
- maximal mechanically permissible operational speed limit,
  see table below, following the requirements of IEC 60034-1; both for horizontal and vertical mounting:

Frame size	2-pole		4-pole		6-pole		8-pole	
	[min^{-1}]	[Hz]	[min-1]	[Hz]	[min^{-1}]	[Hz]	[min^{-1}]	[Hz]
63	5200	87	3600	120	2400	120	1600	106
71	5200	87	3600	120	2400	120	1600	106

250	3600	60	2300	77	1800	90	1200	80
280	-	-	-	-	-	-	-	-
315	-	-	-	-	-	-	-	

Table 5-2: Maximal permissible operational speed

5.3.3 Permissible radial shaft forces

At operation with belt drive (or caused by other influences of the driven equipment) radial forces will impact on shaft end and bearings.

For belt drives a rough estimation of the radial force can be carried out:

$$F_r \cong \frac{5000 \times P}{D \times n}$$

where F_r =radial force [N]
P = power rating [kW]
D = diameter of pulley [m] and
n = speed [rpm].

The permissible radial force depends on the axial point of application of the external force, see figure below:

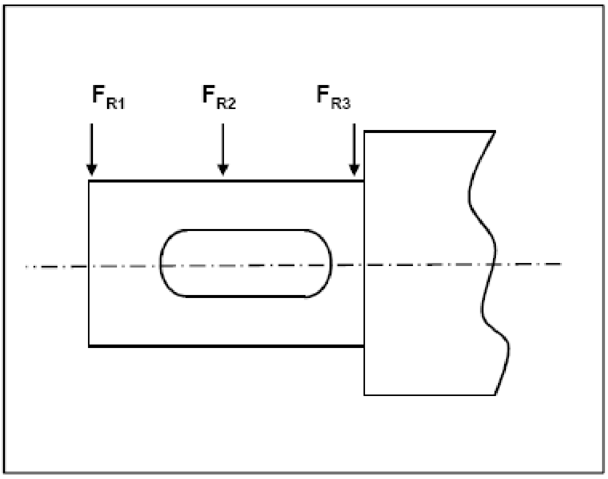

Figure 5-5: Axial point of application of the external radial force

The permissible radial thrust is given in the table below:

- for standard ball bearings and
- for optional version with cylinder roller bearings.

It has to be regarded that cylinder roller bearings demand a minimum radial force for proper operation.

Radial bearing load F_R [N]											
		Load F_R for standard ball bearings						Load F_R for cylinder roller bearings			
		Aluminium motors			Cast iron motors			Cast iron motors			
		Max.	Max.	Max.	Max.	Max.	Max.	Max.	Max.	Max.	Min.

Table 5-3: Permissible radial shaft forces

5.3.4 Permissible axial shaft forces

The permissible external forces in axial direction (direction towards DE or towards NDE) is depending on the mounting position of the motor:

- horizontal shaft,
- shaft up or
- shaft down.

The figures refer to standard bearing design (reinforced version on request) and operation at nominal speed or horizontal mounting; e. g. mounting B3, B5, B6, B7, B8, B14, B34, B35:

Table 5-4: Maximal permissible axial bearing load for mounting position "horizontal"

5.3.5 Vibration

The motors are dynamically balanced with half key and the shaft end face is marked according to standard DIN ISO 8821 (marking “H” = half key).
The balance quality meets DIN ISO 1940, Q2,5.
The mechanical vibrations of the motors meet level A according to EN 60034-14 at synchronous speed; standardized limits see table below (special design like full-key-balancing, no-key-balancing or vibration grade B on request.)

Frame size		56 to 132		160 to 280		> 280	
		Displac.	Veloc.	Displac.	Veloc.	Displac.	Veloc.
	Mounting	[µm]	[mm/s] RMS	[µm]	[mm/s] RMS	[µm]	[mm/s] RMS
Vibration Grade A	**Free suspension**	**25**	**1,6**	**35**	**2,2**	**45**	**2,8**
	Rigid mounting	**21**	**1,3**	**29**	**1,8**	**37**	**2,3**

	Rigid mounting	n.a.	n.a.	14	0,9	24	1,5
Grade “A” applies to machines with no special vibration requirements; Grade “B” applies to machines with special vibration requirements.							

Table 5-5: Vibration limits according to IEC 60034-14

5.4 Motor performance (line operated)

The motors covered by this catalogue are low voltage asynchronous motors; designed for operation at a three phase AC voltage system (depending on the type; availability see 4.1 Stator winding, starting page 37):
- 230 V, 3 AC, 50 Hz,
- 400 V, 3 AC, 50 Hz,
- 690 V, 3 AC, 50 Hz, according to IEC 60038 and
- 265 V, 3 AC, 60 Hz,
- 460 V, 3 AC, 60 Hz.

The motors are designed for efficiency class IE2 (aluminium motors) and for both IE2 and IE3 (cast iron motors).

5.4.1 Requirements for supply voltage and frequency

Permissible tolerances of voltage and frequency at operation
IEC 60034-1 defines 2 ranges of permissible variation of voltage and frequency, “Zone A” and “Zone B”, see figure below:

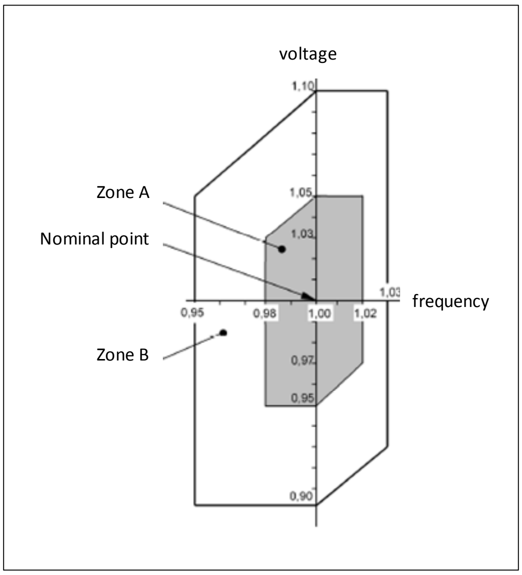

Figure 5-7: Permissible tolerance of voltage and frequency acc. to IEC 60034-1

“Zone A”:
According to IEC 60034-1 the motor is suitable to perform its nominal torque continuously. The performance characteristics may have deviations from the nominal values and the temperature rise is higher than nominal.

“Zone B”:
(continuous operation is explicitly not recommended by IEC 60034-1):
The motor is suitable to perform its nominal torque continuously. The performance characteristics may have greater deviations from the nominal values; the temperature rise is higher than within “Zone A”.

Requirements for waveform and unbalance of the supply voltage:
Distortion of the sinusoidal waveform (caused by neighbouring power electronics) and unbalance of the voltage system (e.g. caused by single-phase loads) is permissible within the limits given in IEC 60034-1 section 7.2.1.1
(distortion factor HVF < 3% and negative sequence component < 1%).

Special requirements (voltage peaks) have to be observed at inverter operation:
see 5.5 Motor performance (inverter operated), starting page 51.

5.4.2 Current, power factor and efficiency at partial load

The general characteristic is shown in section 1 (e.g. Figure 1-4, page 13).
Type specific data for TECO motors:
- Values for the nominal point can be seen on the rating plate and in 6 Technical data, starting page 58.
- Values for partial load (power factor and efficiency) can be seen in 6 Technical data, starting page 58, columns 1/4, 2/4 and 3/4 partial load.

Overload capability according to IEC 60034-1 section 9:
150 % of nominal current during 2 min. at least;
Min. 160 % of full load torque for 15 sec.

5.4.3 Current during starting, limitations

General characteristic: see 1.2 Basics, terms and definitions, starting page 9
(sample for a TECO type test protocol: see Figure 5-4, page 43).
Type specific data for TECO motors are evaluated during type test and are available on request.

Overload capability:

A minimum of overload capability is defined in IEC 60034-1 section 9:
- Min. 2 min. at 150 % of nominal current (for motors with power rating up to 315 kW);
- Min. 160 % of full load torque for 15 sec.

Locked rotor:

The motors are suitable for direct starting; however the high current during starting causes a high thermal load for the stator winding and especially for the rotor.
A maximum locked rotor time has to be regarded, depending on the type. The table below shows the max. duration when starting at cold machine and at nominal operation temperature:

Nominal power [kW]	Maximum locked rotor time [s]: 50 Hz; cast iron; IE2 version (n.a. = not available)							
	2-pole		4-pole		6-pole		8-pole	
	Cold	Hot	Cold	Hot	Cold	Hot	Cold	Hot

5.5 Motor performance (inverter operated)

5.5.1 General

When line operated, asynchronous motors provide an almost fixed rotational speed depending on line frequency and pole number.
When feeding the motor by an electronic frequency inverter with variable frequency and voltage a “Variable Speed Drive System” is generated. It shows remarkable benefits for energy efficiency and enables a low-cost and maintenance-free solution for flexible control of processes.
(Control system which only are varying the voltage are not covered here; they are only permissible for short-term use like soft starters).
Technical details can be seen in IEC 60034-17 (for general purpose motors) and IEC 60034-25 (for motors especially designed for inverter operation).
The motors covered by this catalogue are general purpose motors; they are suitable for operation with a frequency inverter. Several items have to be observed when the motors are inverter operated (details following sections):

	see section ...
General:	
additional losses due to non-sinusoidal supply voltage	5.5.3
increased winding insulation stress	5.5.4
increased acoustic noise level due to non- sinusoidal supply voltage	5.5.7
additional bearing currents	5.5.5
EMC considerations	5.5.6
Depending on operational range:	
decreased cooling of self-ventilated motors at low speed	5.5.3
increased acoustic noise level of self-ventilated motors at high speed	5.5.7
shortening of regreasing intervals when permanently operated at high speed	3.4.4
max speed due to decrease of breakdown torque in the field weakening range	6 (breakdown torque)
Maximum operational speed	5.3.2

5.5.2 Operational range; principle

At inverter operation (variable frequency and voltage) the speed-torque-characteristic curve of the motor (see Figure 1-2, page 11) can be shifted along the speed axis in any position. It allows permanent operation at any speed and torque at both directions of rotation. Depending on the design of the inverter operation in the generator range is possible as well:

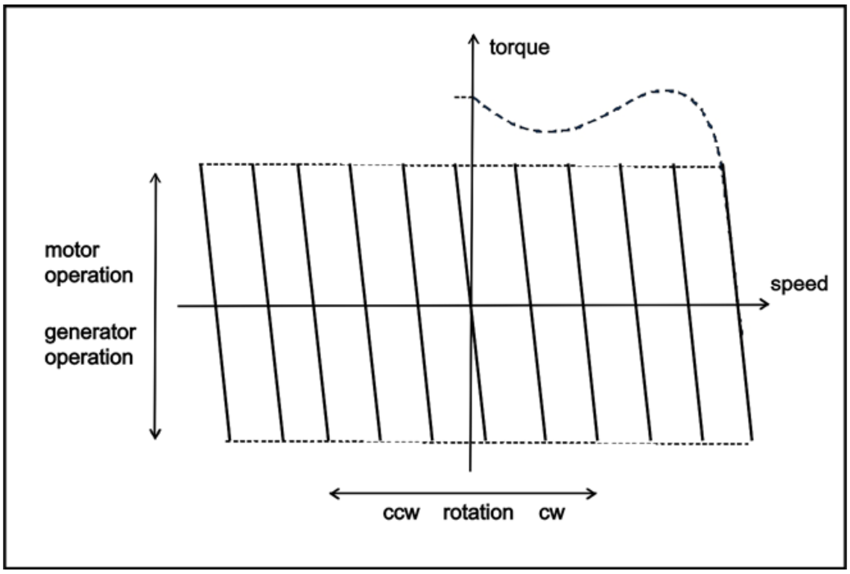

Figure 5-8: Operational range of inverter operated induction motors (range with constant flux)

In addition the frequency can also can be adjusted be higher than the nominal frequency while the voltage is kept constant (field weakening operation).
The operational range then is defined by two sections, see figure below:

- constant flux range: frequency and voltage are almost proportional; the achievable torque is constant
- field weakening range: frequency is increased at constant voltage: the achievable power is constant.
  Remark: In the field weakening range a quadratic decrease of breakdown torque has to be regarded. Thus the max speed may be restricted depending on the motor data.

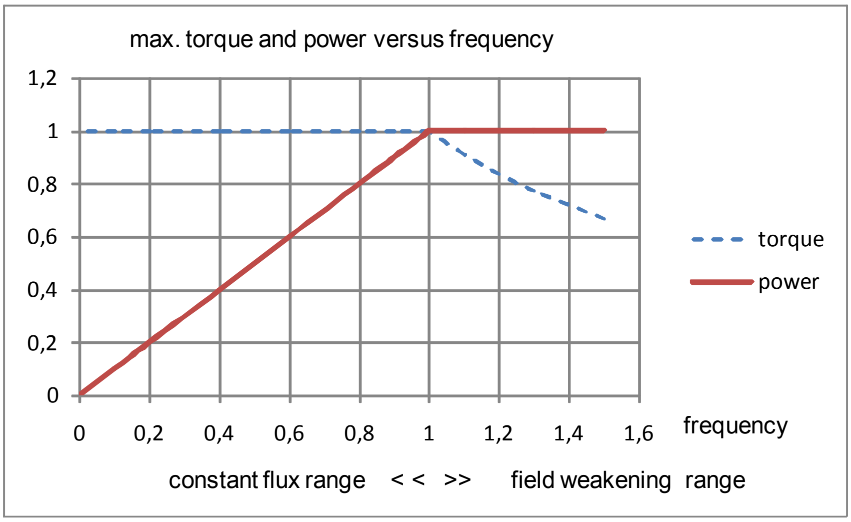

Figure 5-9: Max. torque and power versus frequency

5.5.3 Operational range for continuous operation

In general the inverter provides a non- sinusoidal supply voltage for the motor.
As a consequence additional harmonic currents and additional losses are generated, especially in the rotor.
The amount of additional losses is depending on the design of the inverter. In case of a PMW inverter (voltage source inverter with pulse shaped output voltage) the losses are significantly depending on the pulse frequency. As a rough figure the pulse frequency shall be 3 kHz – 5 kHz at least under this aspect.
Motors covered by this catalogue in general are suitable for continuous operation with nominal output under this precondition.

Configuration for 87 Hz:
If a motor is designed for 50 Hz in star connection of the winding, it can be operated up to 87 Hz in constant flux operation, if the winding connection is changed to delta connection.
The theoretically achievable maximal power then is √3 of nominal at √3 of nominal speed.
However, as the core losses are increased at higher frequency, the output power for continuous operation at 87 Hz is only approximately in the range of 1,5 of nominal (small motors) and 1,2 of nominal (large motors), see figure below:
The exact value for a specific motor type and type of inverter can be evaluated on request.
(Max. mechanical speed for the motor type has to be regarded.)

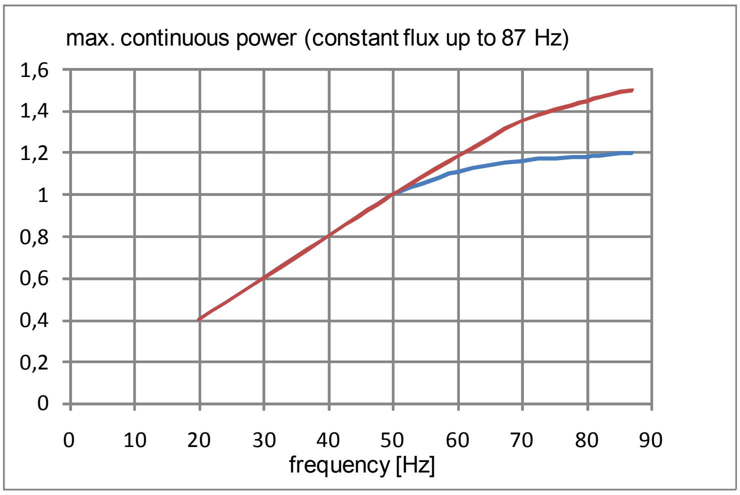

Figure 5-10: Typical characteristics for max. continuous power in “87 Hz- configuration”

Maximum permissible torque and power for continuous operation within the speed range:

In 5.5.2 Operational range; principle the achievable characteristics are shown.
For continuous operation it has to be regarded that the losses of the motor and (in case of self ventilated design) the heat transfer is depending on the operation point.
As a consequence the typical characteristics for maximum permissible torque versus speed (and power versus speed) is given; see figures below.
(speed 0 ...1 = operation with nominal flux; speed > 1= field weakening operation).
The exact value for a concrete motor type and type of inverter can be evaluated on request.

Remark: In the field weakening range a quadratic decrease of breakdown torque has to be regarded. Thus the max speed may be restricted depending on the motor data.

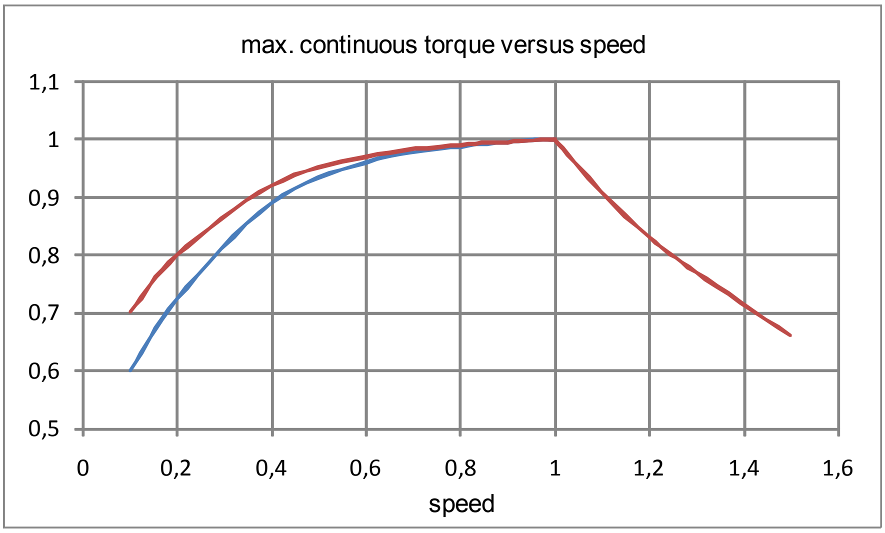

Figure 5-11: Typical max. continuous torque (self ventilated motors)

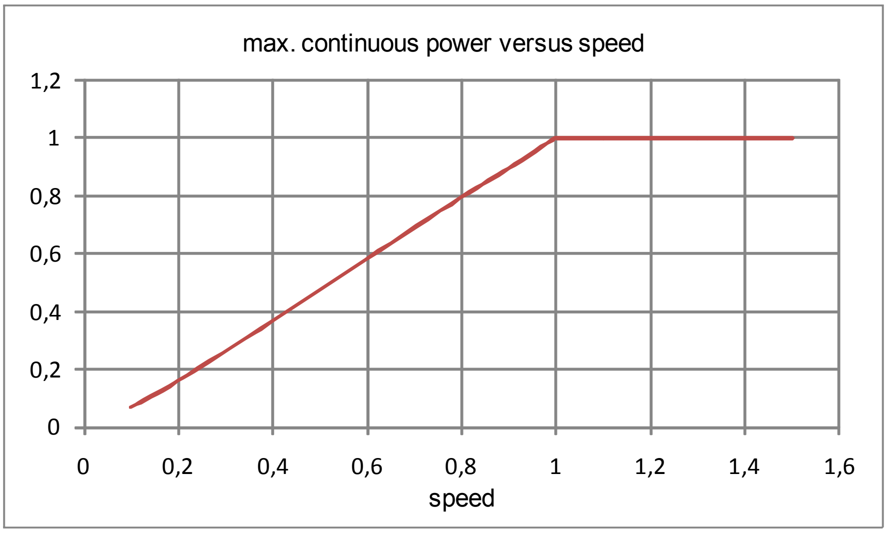

Figure 5-12: Typical max. continuous power (self ventilated motors)

For drive application with quadratic torque characteristic this restriction is not relevant. Drives with constant torque demand either a motor with accordingly higher rating or the use of forced ventilation.
If forced ventilation is used (cooling method “IC416” according to IEC 60034-6) the cooling is independent from the motor speed. Continuous operation is permissible according to figure below:

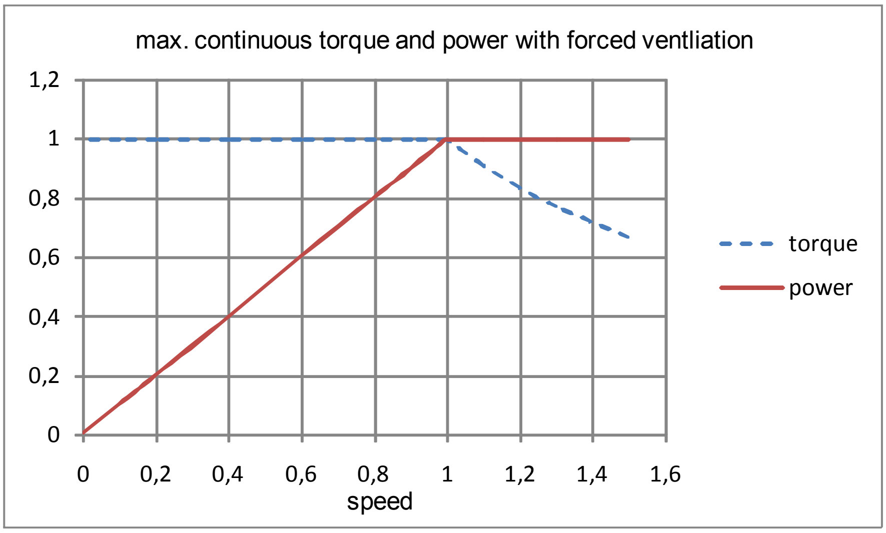

Figure 5-13: Max. continuous torque and power (motors with forced ventilation)

5.5.4 Winding insulation stress

In case of using PWM inverters a pulse shaped voltage is applied to the motor winding. The height of the voltage pulses is depending on the DC link voltage. In addition the voltage pulses show a voltage overshoot. Waveform and peak voltage are a function of both motor cable length and inverter specific pulse shape.

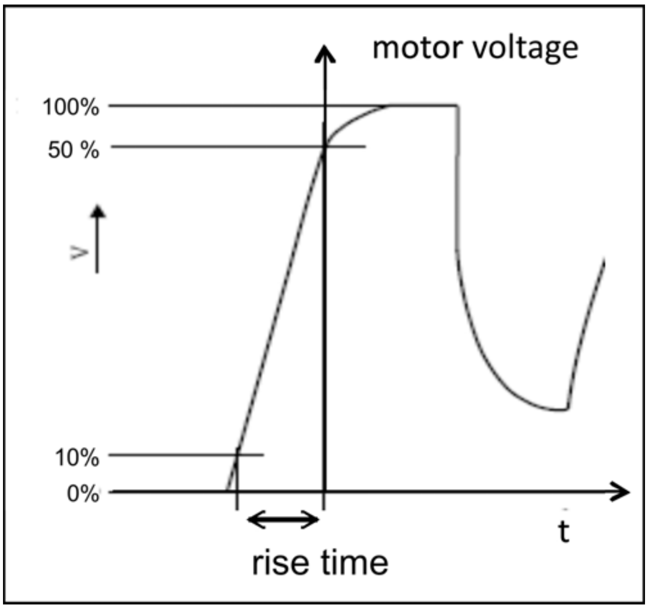

Figure 5-14: Typical pulse waveform and definition of rise time according to IEC 60034-17

Short rise time of the voltage pulses effects an unbalanced voltage contribution within the winding and therefore increases the dielectric stress. The winding stress is defined as a combination of both peak voltage and voltage rise time. A characteristic describes limits for admissible peak voltage versus voltage versus rise time.
In IEC Technical Specification “TS 60034-17” (Cage induction motors when fed from converters- Application guide; edition 2006-05) a limit curve is defined for general purpose motors. Motors covered by this catalogue comply with the curve in this standard, shown in the diagram below:

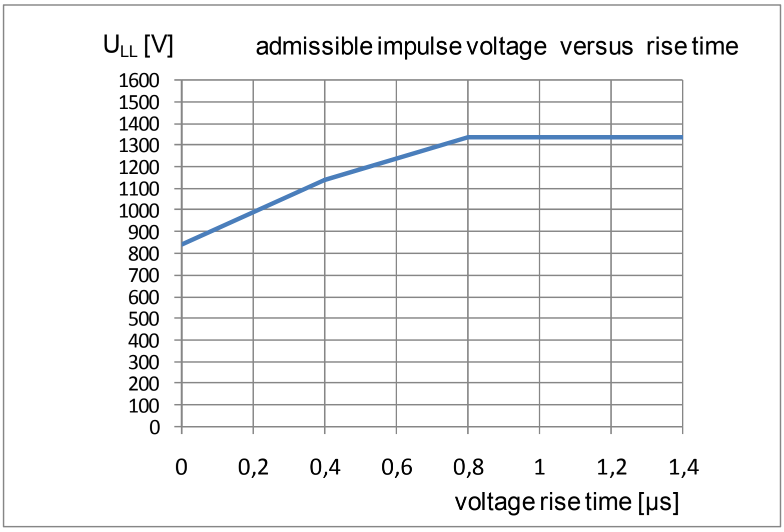

Figure 5-15: Admissible peak voltage versus rise time according to IEC TS 60034-17 (2006)

At high nominal voltage level (e.g. 690 V) and especially in case of long motor cables these requirements can only be fulfilled by using “dV/dt filters” which are increasing the voltage rise time and decrease the amount of voltage overshoot. In some cases even expensive “sine wave filters” may be required.

5.5.5 Inverter caused bearing currents

PWM inverters in general are generating a high frequency “common mode voltage”. There are several mechanisms which can produce harmful high frequency current through the bearings.
A listing of possible counter measures can be seen below:

Counter measure	Remarks
Insulation of NDE bearing	Recommended by TECO for frame size 280 and higher
Inverter filters (dV/dt filter; common mode filter)	
Choice of a low inverter switching frequency	
Use of non- conductive coupling	
Symmetric power cabling and effective motor grounding	

As a simplified rule to avoid problems both with bearing current and winding insulation TECO recommends general precautions according table below (voltage limits according to the insulation system chosen has to be regarded):

TECO general recommendations		
Rated voltage	Frame size < 250	Frame size ≥ 280
≤ 460 V	Standard motor (Motor cable lengths < 20m)	Standard motor + Insulated NDE bearing
≤ 600V	Standard motor + dV/dt-filter (reactor) or Reinforced insulation	Standard motor + dV/dt-filter (reactor) + Insulated NDE bearing or Reinforced insulation + Insulated NDE bearing
≤ 690V	Reinforced insulation + dV/dt-filter (reactor)	Reinforced insulation + dV/dt-filter (reactor) + Insulated NDE bearing

Table 5-6: TECO recommendations for general precautions at inverter operation

5.5.6 Electromagnetic compatibility

If squirrel cage motors are line operated, the electromagnetic emissions are regarded as negligible (see IEC 60034-1, section 13).The motors meet the limit values of Class B of EN 55011 and therefore can be used both in industrial and residential environment.

If inverter operated the EMC performance can only be considered for the complete drive system (inverter, filters, cabling, motor) as an entity, according to the relevant product standard EN 61800-3 (“Adjustable speed electrical power drive systems; EMC requirements and specific test methods...”).

For this purpose TECO motors e.g. are equipped with a metallic terminal box with cable entries suitable for the use of EMC- compliant cable glands.

5.5.7 Additional acoustic noise

Due to the non-sinusoidal motor voltage the acoustic noise level in general is increased at inverter operation. The increase is depending on the type and technical data of the inverter (at PWM inverters especially the pulse frequency and the pulse generation method) and cannot be stated generally.

Increase at nominal speed:
As a rule of thumb an increase at nominal speed can be expected when fed from inverter:
- approx. 1- 3 dB(A) in case of a current source inverter or a PWM inverter with high pulse frequency
- approx. 1- 10 dB(A) in case of a customary PWM inverter.

If acoustic noise is a relevant feature in the application, the cast iron version shall be preferred instead of aluminium design.

Speeds higher than nominal speed:
Self ventilated motors are generating an increased fan noise at higher speed. A rough estimation for the increase of overall sound level is shown in the table below (the increase can be minimized by using the option “Forced ventilation”).

	Increase of sound pressure level [dB(A)]			
	50 Hz	60 Hz	75 Hz	100 Hz
2-pole motor	0	4	10	16
4-pole motor	0	3	7	12
6 and 8 pole motor	0	3	6	8

Table 5-7: Acoustic sound increase to be expected at high speed (self ventilated motors)

6 Technical data

6.1 General data; tolerances (acc. to IEC 60034-1)

Rating, Performance		
Product Group, Design standard	Low Voltage Squirrel Cage Induction Motor, IEC 60034	
Nominal voltages	3 AC; 230 V – 690 V; tolerance see Figure 5-7, page 48	
Winding configuration	Star /Delta, 6 winding ends	
Winding temperature rise	Less than 80 K acc. Utilization B (by resistance method)	
Method of starting	Full Voltage Direct On Line or Star/Delta starting	
Nominal frequency	50 Hz or 60 Hz; tolerance according to IEC 60034-1	
Inverter Operation	Suitable for inverter operation according to IEC 60034-17	
Output range	0,12 kW – 315 kW	
Duty type	Continuous (S1); SF 1.0 (data for other duty types on request)	
Efficiency	IE2 or IE3 according to IEC 60034-30	
Range of frame size	From 63 up to 315	
Pole numbers	2-pole; 4-pole; 6-pole and 8-pole	
Rotational speed (synchronous)	750 rpm – 3000 rpm (50 Hz); 900 rpm – 3600 rpm (60 Hz)	
Operational speed limit	See 5.3.2 Maximum operational speed, starting page 43	
Rotational direction	Clockwise acc. IEC definition; suitable for bidirectional operation	
Locked rotor torque	Tolerance:	- 15 %; + 25 %
Pull up torque	Tolerance:	- 15 % (Minimum: 30 % of FLT)
Breakdown torque	>160 % of full load torque; tolerance – 10 % included	
Slip	Tolerance:	± 30 % for rating < 1 kW; ± 20 % for rating ≥ 1 kW
Efficiency η	Tolerance:	- 0,15 (1 – η) for rating < 150 kW; - 0,1 (1 – η) for rating ≥ 150 kW
Power factor cos φ	Tolerance:	(1 – cos φ) /6 (min. 0,02; max 0,07)
Locked rotor current	Tolerance:	+ 20 %
Acoustic noise level	Tolerance	+ 3dB(A) acc. to IEC 60034-1
Vibration Level	Level A according to IEC 60034-14	

Application, Construction	
Site condition	Shadow, Non-hazardous
Ambient Temperature	- 20°C to + 40°C
Site Altitude	Less than 1000 m
Relative Humidity	Less than 90 % RH (Non- Condensation)
Enclosure	Totally Enclosed (IP 55 acc. to IEC)
Cooling Method	Self Ventilated, Surface Cooled, "TEFC" (IC 411 acc. to IEC code)
Mounting	Foot Mounting (B3), Flange Mounting (B5 and B14) and derivatives
Stator Winding	Random Wound, Copper wire, Thermal class F insulation
Rotor Winding	Squirrel cage, Aluminium Conductor
Power Connectors	See section 3.2 Terminal box and cable entry, starting page 21
Bearings, Lubrication	See section 3.4 Rotor assembly (active part, shaft, bearings), starting page 27
Material (housing, end shields)	Die-Casting Aluminium ("ALAA...") or Cast Iron ("ALCA...")
Painting	Pebble Grey (RAL 7032)

General tolerances of dimensions (nomenclature acc. dimensional diagram)		
Motor mass	m	- 5 % ... + 10 %
Rotor inertia	J	± 10 %
Radial spacing of feet fixing holes	A	± 1 mm
Axial spacing of feet fixing holes	B	± 1 mm
Shaft height	H	frame ≤ 250: - 0,5 mm; frame > 250: -1mm
Pitch circle diameter of flange	M	± 0,8 mm
Shaft end diameter	D	see dimensional diagram

6.2 Type data for aluminium version

Remarks (valid for all following tables with performance data):

1. The typical values above are based on test according to IEC 60034, especially IEC 60034-2-1.
2. All tolerances are according to IEC 60034-1.
3. Design and operation at other nominal voltages:
   The full load current has to be calculated inversely with the voltage; all other data are the same.
4. Rating 0,55 kW and below and 8-pole motors anD* marked values: Efficiency per TECO performance standard.

6.2.1 Aluminium; 400 V; 50 Hz; Class IE2

9 Packing, labelling

9.1 Packing design

If not otherwise specified, the motors are delivered as described below.
Motors are appropriately packed for the shipping and transport method (mainly ship and truck).
Within its individual cartons or crates the motors are sealed in foil to prevent spillage and mechanically fixed to avoid movement. A desiccant (like silica gel) is contained within the foil to prevent condensation.

9.1.1 Motors up to frame size 90

The motors are carton packed and placed on individually designed pallets.
The motors cartons have two handling bars for carrying appropriate to withstand the motor weight.
In a second function these handling bars give easy access to the nameplate of the motor. Therefore change of the brand label is possible without unpacking the motor.

The cartons can be piled in 1 - 3 layers on a pallet (see table below).
The pallets for carton packed motors are designed for fork lifter use with similar fork access space (max 145mm centre blocks) as for euro pallets.(pallet dimensions see table below).

Frame size	Single carton dimensions	max. pallet dimensions	max. motors per unit	max. mass, (depending on type)
	L x W x H	L x W x H		m
	[mm]	[mm]	pieces	[kg]
63	300 x 220 x 230	1100 x 800 x 900	52	
71	300 x 220 x 240	1100 x 800 x 900	52	
80	360 x 233 x 250	1100 x 800 x 900	30	730 - 900
90	450 x 250 x 270	1100 x 800 x 970	21	660 - 900

Table 9-1: Packing data of cartons and pallets

9.1.2 Motors frame size 100 to 315

The motors are packed in pallet based crates. It is possible to pile the crates according to table below:

Frame size	Single crate dimensions	max. layer use	max. pallet dimensions	max. motors per unit	max.mass, (depending on type)
	L x W x H		L x W x H		m
	[mm]	layers	[mm]	pieces	[kg]
100	530 x 350 x 385	3	1100 x 800 x 1000	18	900 - 1150
112	530 x 350 x 385	3	1050 x 930 x 900	12	750 – 1050
132	570 x 440 x 385	3	1160 x 800 x 1020	8	750 – 1050
160	750 x 450 x 590	3	750 x 900 x 720	2	300 – 425
180	840 x 490 x 625	3	980 x 840 x 1380	4	900 – 1250
200	990 x 580 x 740	2	990 x 590 x 750	1	300 - 400
225	990 x 580 x 740	2	990 x 590 x 750	1	370 -520
250	1090 x 630 x 800	1	1090 x 630 x 800	1	500 - 650
280		1		1	
315		1		1	

Table 9-2: Packing data

9.2 Labelling

Each motor has an identification sticker which provides the following information encoded in clear text as well as in barcode (part of the 128 family).

The sticker is placed:
- with carton packed motors: on one side of the carton
- with crate packed motors: one sticker on side of the crate.

	Clear Text	Barcode
Article No.	X	X
Motor individual serial number	X	X
Catalogue No.	X	
Voltage	X	
Power	X	
Poles	X	
Mounting arrangement	X	

10 Quality assurance

According to the requirements of IEC 60 034-1 the following tests are carried out at least:

- Type test (for a certain type of motor) and
- Routine test (carried out on each individual motor.

The contents of these tests according to IEC are listed in the table below:

Code	Test Item	Type Test	Routine Test
1	Outline dimension inspection	X	X
2	Stator winding resistance (cold)	X	X
3	Insulation resistance (before high voltage test; item 8)	X	
4	Test of rotational direction	X	X
5	Locked rotor current	X	X
6.1	No load curve (current, power)	X	
6.2	Nominal no load point (current, power)	X	X
7.1	Heat run test	X	
7.2	Winding resistance hot (after heat run test)	X	
7.3	Losses segregation (evaluation of efficiency)	X	
8	High voltage test	X	X
9	Insulation resistance (after high voltage test; item 8)	X	X
10.1	Vibration test	X	
10.2	Acoustic noise test	X	

11 Documentation

Together with each motor the following documentation is delivered:

- Barcode label (see 9.2 Labelling, page 120)
- Safety instruction:
  A short form safety instructions according to demands of European directive 2006/95/EG is delivered together with each single motor (attached in carton box or safely fixed on eye bolt of crate packed motors).
  The manual is available in the most common EU languages.

The following documentation can be provided on request:

- A detailed start up and operation manual is available in English, German, French, Italian and Spanish language; it is available for download and as a hardcopy in TECO EU offices
  (TECO file name: “INSTALLATION, OPERATION and MAINTENANCE INSTRUCTIONS FOR TECO LOW VOLTAGE MOTORS TYPE ALAA and ALCA”).
- EC certificate of conformity (Low Voltage Directive 2006/95/EC; EMC Directive 2004/108/EC)
- EC- Declaration of Incorporation according to Machinery Directive 2006/42/EC
- Data sheet and individual dimensional diagram
- Inspection certificate according to EN 10204:2004.
